

Dumps ARA-C01 Cost & Test ARA-C01 Collection

BTW, DOWNLOAD part of TestkingPass ARA-C01 dumps from Cloud Storage: https://drive.google.com/open?id=1_wPReExheBGMf_cuWyKF-stwZwO6FYGD

Those who are ambitious to obtain ARA-C01 certification mainly include office workers; they expect to reach a higher position and get handsome salary, moreover, a prosperous future. All of these requirements our ARA-C01 exam materials can meet. Our ARA-C01 study materials can help you pass the exam successful. Before you decide to buy our ARA-C01 Exam Torrent, you can free download the demo of our ARA-C01 exam questions, which contains a few of questions and answers of our ARA-C01 training guide.

The SnowPro Advanced Architect Certification exam is an online, proctored exam that consists of 60 multiple-choice questions. ARA-C01 exam content is designed to test the candidate's knowledge of the Snowflake platform and its various features. ARA-C01 exam is timed, and candidates have two hours to complete it. SnowPro Advanced Architect Certification certification is a globally recognized certification, and it allows professionals to showcase their expertise in Snowflake's cloud data platform.

Snowflake ARA-C01 Certification Exam covers a wide range of topics, including Snowflake architecture design, Snowflake security, performance tuning, data integration, and data governance. ARA-C01 exam is intended to test the candidate's deep understanding of these topics and their ability to apply the best practices to design and implement Snowflake solutions. ARA-C01 exam is conducted online and consists of multiple-choice questions that are designed to test the candidate's knowledge and practical skills.

Test ARA-C01 Collection, ARA-C01 Passing Score Feedback

Comparing to other training institution, our valid ARA-C01 vce dumps are affordable, latest and cost-effective, which can overcome the difficulty of valid ARA-C01 Actual Test and ensure you pass the exam. It can not only save your time and money, but also help you clear Snowflake practice exam with high rate.

Snowflake ARA-C01: SnowPro Advanced Architect Certification Exam is a highly regarded certification exam in the field of data warehousing and cloud computing. It is designed to test the advanced knowledge and skills of architects who are responsible for designing and implementing complex data warehousing solutions using Snowflake's cloud data platform.

Snowflake SnowPro Advanced Architect Certification Sample Questions (Q36-Q41):

NEW QUESTION # 36

What actions are permitted when using the Snowflake SQL REST API? (Select TWO).

- A. Submitting multiple SQL statements in a single call
- B. The use of a PUT command
- C. The use of a GET command
- D. The use of a ROLLBACK command
- E. The use of a CALL command to a stored procedure which returns a table

Answer: A,E

NEW QUESTION # 37

Which Snowflake data modeling approach is designed for BI queries?

- A. Snowflake schema
- B. Star schema
- C. Data Vault
- D. 3 NF

Answer: A

NEW QUESTION # 38

Why might a Snowflake Architect use a star schema model rather than a 3NF model when designing a data architecture to run in Snowflake? (Select TWO).

- A. The Architect wants to remove data duplication from the data stored in Snowflake.
- B. The Architect wants to present a simple flattened single view of the data to a particular group of end users.
- C. The Architect is designing a landing zone to receive raw data into Snowflake.
- D. Snowflake cannot handle the joins implied in a 3NF data model.
- E. The BI tool needs a data model that allows users to summarize facts across different dimensions, or to drill down from the summaries.

Answer: B,E

Explanation:

A star schema model is a type of dimensional data model that consists of a single fact table and multiple dimension tables. A 3NF model is a type of relational data model that follows the third normal form, which eliminates data redundancy and ensures referential integrity. A Snowflake Architect might use a star schema model rather than a 3NF model when designing a data architecture to run in Snowflake for the following reasons:

A star schema model is more suitable for analytical queries that require aggregating and slicing data across different dimensions, such as those performed by a BI tool. A 3NF model is more suitable for transactional queries that require inserting, updating, and deleting individual records.

A star schema model is simpler and faster to query than a 3NF model, as it involves fewer joins and less complex SQL statements. A 3NF model is more complex and slower to query, as it involves more joins and more complex SQL statements. A star schema model can provide a simple flattened single view of the data to a particular group of end users, such as business analysts or data scientists, who need to explore and visualize the data. A 3NF model can provide a more detailed and normalized view of the data to a different group of end users, such as application developers or data engineers, who need to maintain and update the data.

The other options are not valid reasons for choosing a star schema model over a 3NF model in Snowflake:

Snowflake can handle the joins implied in a 3NF data model, as it supports ANSI SQL and has a powerful query engine that can optimize and execute complex queries efficiently.

The Architect can use both star schema and 3NF models to remove data duplication from the data stored in Snowflake, as both models can enforce data integrity and avoid data anomalies. However, the trade-off is that a star schema model may have more data redundancy than a 3NF model, as it denormalizes the data for faster query performance, while a 3NF model may have less data redundancy than a star schema model, as it normalizes the data for easier data maintenance.

The Architect can use both star schema and 3NF models to design a landing zone to receive raw data into Snowflake, as both models can accommodate different types of data sources and formats. However, the choice of the model may depend on the purpose and scope of the landing zone, such as whether it is a temporary or permanent storage, whether it is a staging area or a data lake, and whether it is a single source or a multi-source integration.

NEW QUESTION # 39

A retail company has 2000+ stores spread across the country. Store Managers report that they are having trouble running key reports related to inventory management, sales targets, payroll, and staffing during business hours. The Managers report that performance is poor and time-outs occur frequently.

Currently all reports share the same Snowflake virtual warehouse.

How should this situation be addressed? (Select TWO).

- A. Use a Business Intelligence tool for in-memory computation to improve performance.
- B. Configure the virtual warehouse to be multi-clustered.
- C. Configure a dedicated virtual warehouse for the Store Manager team.
- D. Configure the virtual warehouse to size 4-XL
- E. Advise the Store Manager team to defer report execution to off-business hours.

Answer: B,C

Explanation:

The best way to address the performance issues and time-outs faced by the Store Manager team is to configure a dedicated virtual warehouse for them and make it multi-clustered. This will allow them to run their reports independently from other workloads and scale up or down the compute resources as needed. A dedicated virtual warehouse will also enable them to apply specific security and access policies for their data. A multi-clustered virtual warehouse will provide high availability and concurrency for their queries and avoid queuing or throttling.

Using a Business Intelligence tool for in-memory computation may improve performance, but it will not solve the underlying issue of insufficient compute resources in the shared virtual warehouse. It will also introduce additional costs and complexity for the data architecture.

Configuring the virtual warehouse to size 4-XL may increase the performance, but it will also increase the cost and may not be optimal for the workload. It will also not address the concurrency and availability issues that may arise from sharing the virtual warehouse with other workloads.

Advising the Store Manager team to defer report execution to off-business hours may reduce the load on the shared virtual warehouse, but it will also reduce the timeliness and usefulness of the reports for the business. It will also not guarantee that the performance issues and time-outs will not occur at other times.

NEW QUESTION # 40

A company has a Snowflake account named ACCOUNTA in AWS us-east-1 region. The company stores its marketing data in a Snowflake database named MARKET_DB. One of the company's business partners has an account named PARTNERB in Azure East US 2 region. For marketing purposes the company has agreed to share the database MARKET_DB with the partner account. Which of the following steps MUST be performed for the account PARTNERB to consume data from the MARKET_DB database?

- A. Create a new account (called AZABC123) in Azure East US 2 region. From account ACCOUNTA replicate the database MARKET_DB to AZABC123 and from this account set up the data sharing to the PARTNERB account.
- B. Create a share of database MARKET_DB, and create a new database out of this share locally in AWS us-east-1 region. Then replicate this database to the partner's account PARTNERB.
- C. Create a new account (called AZABC123) in Azure East US 2 region. From account ACCOUNTA create a share of database MARKET_DB, create a new database out of this share locally in AWS us-east-1 region, and replicate this new database to AZABC123 account. Then set up data sharing to the PARTNERB account.
- D. From account ACCOUNTA create a share of database MARKET_DB, and create a new database out of this share locally in AWS us-east-1 region. Then make this database the provider and share it with the PARTNERB account.

Answer: A

Explanation:

Snowflake supports data sharing across regions and cloud platforms using account replication and share replication features. Account replication enables the replication of objects from a source account to one or more target accounts in the same organization. Share replication enables the replication of shares from a source account to one or more target accounts in the same organization¹.

To share data from the MARKET_DB database in the ACCOUNTA account in AWS us-east-1 region with the PARTNERB account in Azure East US 2 region, the following steps must be performed:

Create a new account (called AZABC123) in Azure East US 2 region. This account will act as a bridge between the source and the target accounts. The new account must be linked to the ACCOUNTA account using an organization².

From the ACCOUNTA account, replicate the MARKET_DB database to the AZABC123 account using the account replication feature. This will create a secondary database in the AZABC123 account that is a replica of the primary database in the ACCOUNTA account³.

From the AZABC123 account, set up the data sharing to the PARTNERB account using the share replication feature. This will create a share of the secondary database in the AZABC123 account and grant access to the PARTNERB account. The PARTNERB account can then create a database from the share and query the data⁴.

Therefore, option C is the correct answer.
