

Salesforce MuleSoft-Integration-Architect-I Dumps Material Formats

What's more, part of that PracticeMaterial MuleSoft-Integration-Architect-I dumps now are free: https://drive.google.com/open?id=1gaw42Y0l9hG9D7OXAEneNF9Gg_qtKrwQ

The software version is one of the three versions of our MuleSoft-Integration-Architect-I exam prep. The software version has many functions which are different with other versions'. On the one hand, the software version of MuleSoft-Integration-Architect-I test questions can simulate the real examination for all users. By actually simulating the test environment, you will have the opportunity to learn and correct self-shortcoming in study course. On the other hand, although you can just apply the software version in the windows operation system, the software version of MuleSoft-Integration-Architect-I Exam Prep will not limit the number of your computer. If you use the software version, you can download the app more than one computer, but you can just apply the software version in the windows operation system. We believe the software version of our MuleSoft-Integration-Architect-I test torrent will be very useful for you, we hope you can pass you exam and get your certificate successfully.

Salesforce MuleSoft-Integration-Architect-I Exam Syllabus Topics:

Section	Weight	Objectives
Topic 1: Designing for Runtime Plane Technology Architecture	20%	- Design for scalability, fault tolerance, and performance - Compare and select Mule runtime domains - Apply reactive event processing model - Use class loader isolation to avoid conflicts - Design solutions for CloudHub
Topic 2: Designing Architecture Using Integration Paradigms	30%	- Implement event-driven architectures and message brokers - Design with web APIs and HTTP - Apply API-led connectivity principles - Select appropriate integration styles - Use messaging patterns and technologies
Topic 3: Designing and Developing Mule Applications	12%	- Use core features and routers effectively - Integrate with Salesforce and other connectors - Configure application properties and environments - Apply best practices for maintainability
Topic 4: Initiating Integration Solutions on Anypoint Platform	8%	- Differentiate functional and non-functional requirements - Select features for API design and management - Choose appropriate deployment options - Apply MuleSoft Catalyst principles
Topic 5: Designing Integration Solutions to Meet Performance Requirements	7%	- Design for performance and capacity goals - Use streaming features effectively - Process large message volumes and sequences

Topic 6: Applying DevOps Practices and Operating Integration Solutions	14%	- Design CI/CD pipelines with Mule tools - Manage governance and operational readiness - Implement monitoring, logging, and alerting - Automate Anypoint Platform interactions
Topic 7: Designing Integration Solutions to Meet Reliability Requirements	11%	- Differentiate high availability and disaster recovery - Use error handling and scope strategies - Select transaction strategies and alternatives - Apply local and XA transaction patterns
Topic 8: Designing Integration Solutions to Meet Security Requirements	8%	- Protect data in transit and at rest - Design edge security using Anypoint Security - Apply authentication and authorization standards - Secure access to control plane and APIs

New MuleSoft-Integration-Architect-I Exam Discount | MuleSoft-Integration-Architect-I Hot Spot Questions

PracticeMaterial is also offering 1 year free MuleSoft-Integration-Architect-I updates. You can update your MuleSoft-Integration-Architect-I study material for 90 days from the date of purchase. The MuleSoft-Integration-Architect-I updated package will include all the past questions from the past papers. You can pass the Salesforce MuleSoft-Integration-Architect-I Exam easily with the help of the dumps. It will have all the questions that you should cover for the Salesforce MuleSoft-Integration-Architect-I exam. If you are facing any issues with the products you have, then you can always contact our 24/7 support to get assistance.

Salesforce Certified MuleSoft Integration Architect I Sample Questions (Q216-Q221):

NEW QUESTION # 216

A Mule application is synchronizing customer data between two different database systems.

What is the main benefit of using eXtended Architecture (XA) transactions over local transactions to synchronize these two different database systems?

- A. An XA transaction synchronizes the database systems with the least amount of Mule configuration or coding
- B. An XA transaction automatically rolls back operations against both database systems if any operation fails
- **C. An XA transaction handles the largest number of requests in the shortest time**
- D. An XA transaction writes to both database systems as fast as possible

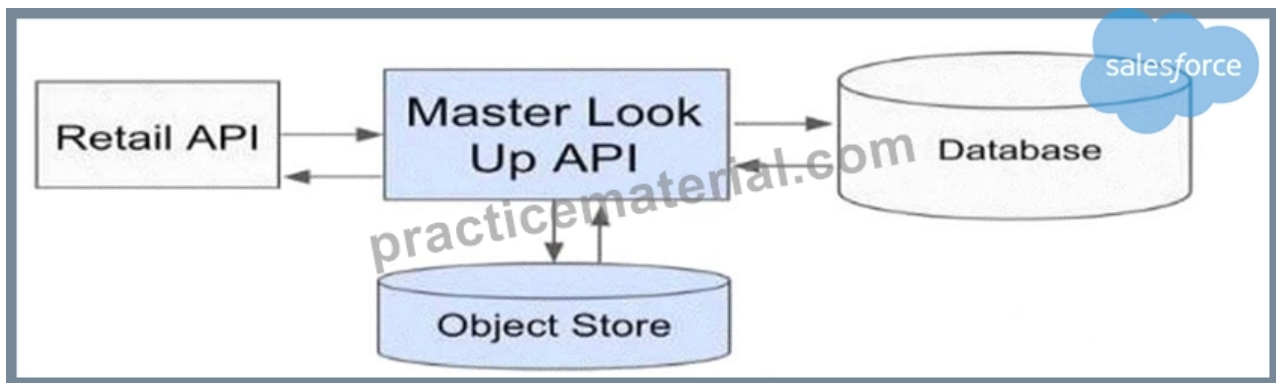

Answer: C

NEW QUESTION # 217

A manufacturing company is developing a new set of APIs for its retail business. One of the APIs is a Master Look Up API, which is a System API. The API uses a persistent object-store. This API will be used by almost all other APIs to provide master lookup data.

The Master Look Up API is deployed on two CloudHub workers of 0.1 vCore each because there is a lot of master data to be cached. Most of the master lookup data is stored as a key-value pair. The cache gets refreshed if the key is not found in the cache. During performance testing, it was determined that the Master Look Up API has a high response time due to the latency of database queries executed to fetch the master lookup data.

What two methods can be used to resolve these performance issues?

Choose 2 answers

- A. Implement the HTTP caching policy for all GET endpoints for the Master Look Up API
- B. Implement locking to synchronize access to the Object Store
- C. Upgrade the vCore size from 0.1 vCore to 0.2 vCore
- D. Implement an HTTP caching policy for all GET endpoints in the Master Look Up API

Answer: A,C

Explanation:

AnTo resolve performance issues with the Master Look Up API, the following methods can be applied:

- * Implement the HTTP caching policy for all GET endpoints for the Master Look Up API: This caching policy helps reduce the number of database queries by storing frequently accessed data in cache, thus improving response times for subsequent requests.
- * Upgrade the vCore size from 0.1 vCore to 0.2 vCore: Increasing the vCore size can provide more computational resources, which can improve the processing power and overall performance of the API, particularly under high load conditions.

References:

- * HTTP Caching Policy
- * Scaling and Performance

swer: A

NEW QUESTION # 218

In Anypoint Platform, a company wants to configure multiple identity providers (Idps) for various lines of business (LOBs). Multiple business groups and environments have been defined for these LOBs. What Anypoint Platform feature can use multiple Idps to access the company's business groups and environment?

- A. User management
- B. Client Management
- C. Roles and permissions
- D. Dedicated load balancers

Answer: B

Explanation:

Correct answer is Client Management

* Anypoint Platform acts as a client provider by default, but you can also configure external client providers to authorize client applications.

* As an API owner, you can apply an OAuth 2.0 policy to authorize client applications that try to access your API. You need an OAuth 2.0 provider to use an OAuth 2.0 policy.

* You can configure more than one client provider and associate the client providers with different environments. If you configure multiple client providers after you have already created environments, you can associate the new client providers with the environment.

* You should review the existing client configuration before reassigning client providers to avoid any downtime with existing assets or APIs.

* When you delete a client provider from your master organization, the client provider is no longer available in environments that used it.

* Also, assets or APIs that used the client provider can no longer authorize users who want to access them.

-----MuleSoft Reference:

NEW QUESTION # 219

An organization's IT team follows an API-led connectivity approach and must use Anypoint Platform to implement a System API that securely accesses customer data. The organization uses Salesforce as the system of record for all customer data, and its most important objective is to reduce the overall development time to release the System API.

The team's integration architect has identified four different approaches to access the customer data from within the implementation of the System API by using different Anypoint Connectors that all meet the technical requirements of the project.

- A. Use the Anypoint Connector for HTTP to connect to the Salesforce APIs to directly access the customer data
- B. Use the Anypoint Connector for Database to connect to a MySQL database to access a copy of the customer data
- C. Use the Anypoint Connector for FTP to download a file containing a recent near-real time extract of the customer data
- **D. Use the Anypoint Connector for Salesforce to connect to the Salesforce APIs to directly access the customer data**

Answer: D

NEW QUESTION # 220

A company is using Mulesoft to develop APIs and deploy them to Cloudhub and on-premises targets. Recently it has decided to enable Runtime Fabric deployment option as well and infrastructure is set up for this option.

What can be used to deploy Runtime Fabric?

- A. Anypoint platform REST APIs
- **B. Mule Maven plug-in**
- C. Directly uploading a JAR file from the Runtime manager
- D. Anypoint CLI

Answer: B

NEW QUESTION # 221
