## WGU Managing Cloud Security (JY02) Sample Questions (Q74-Q79):

### NEW QUESTION # 74

An organization is considering a cloud provider that has multivendor pathway connectivity. What does this feature provide?

- A. Connections to several internet service providers
- B. Contracts with heating, ventilation, and air conditioning (HVAC) providers
- C. Connections to several electric providers that are not on the same grid
- D. Contracts with fuel providers

**Answer: A**

Explanation:

Multivendor pathway connectivity refers to a cloud provider's ability to maintain connections with multiple internet service providers (ISPs). This ensures redundancy and reduces the risk of outages due to a single ISP failure.

Electric providers, fuel vendors, and HVAC contracts support facility resilience, but they are not directly tied to connectivity. The purpose of multivendor pathways is specifically to guarantee uninterrupted network access and resilience for customer workloads. By maintaining ISP redundancy, cloud providers improve availability and meet SLA commitments. This capability is especially critical for enterprises requiring high uptime or operating in regions where connectivity disruptions are common. It also provides flexibility in bandwidth management and routing optimization.

### NEW QUESTION # 75

Which cloud storage architecture enhances the opportunity for data policy enforcement such as data loss prevention (DLP)?

- A. Ephemeral
- B. Object
- C. Database
- D. Flash

**Answer: B**

Explanation:

Object storage architecture enhances the opportunity for enforcing data policies such as data loss prevention (DLP). Managing Cloud principles explain that object storage supports extensive metadata tagging, which allows organizations to classify data, apply sensitivity labels, and enforce security policies directly at the storage level.

By leveraging metadata, DLP solutions can identify sensitive information, apply access restrictions, trigger alerts, or prevent unauthorized data movement. Policies can be consistently enforced across large-scale cloud environments without relying on application-level controls. This makes object storage particularly effective for managing unstructured data such as documents, media files, and backups.

The other options do not provide the same level of policy enforcement. Flash storage focuses on performance, databases rely on structured schemas, and ephemeral storage is temporary and unsuitable for persistent policy enforcement. Therefore, object storage is the most effective architecture for enabling strong data governance and DLP controls in cloud environments.

### NEW QUESTION # 76

Which role in cloud computing provides products or services that interact with the primary offering of a cloud service provider?

- A. Cloud service developer
- B. Customer
- C. Regulator
- D. Cloud service partner

**Answer: D**

Explanation:

A cloud service partner plays a complementary role by offering products or services that enhance or interact with the primary cloud provider's offerings. Examples include managed service providers, value-added resellers, or software vendors that integrate their solutions with the core infrastructure or platform of a cloud service provider.

The customer is the end user of cloud services, regulators ensure compliance with laws, and developers create applications but do not represent an independent ecosystem role. Partners, on the other hand, extend the value of the primary offering by providing additional tools, support, or integrations that enhance customer experience.

This ecosystem role is recognized by major cloud frameworks, such as the Cloud Security Alliance, which notes the importance of partners in ensuring interoperability, extending services, and supporting shared responsibility. For customers, this means greater flexibility and choice in tailoring cloud solutions to business needs.

#### NEW QUESTION # 77

Which cloud storage architecture allows the digital rights management (DRM) solutions to associate metadata with the materials in storage?

- A. File
- B. Relational database
- C. Object-based
- D. Volume

**Answer: C**

Explanation:

Object-based storage architecture allows digital rights management (DRM) solutions to associate metadata directly with stored materials. Managing Cloud documentation highlights that object storage is designed to store data as discrete objects, each containing the data itself, a unique identifier, and customizable metadata.

This metadata capability is essential for DRM solutions, as it enables the attachment of usage rights, access restrictions, expiration rules, and ownership information to digital content. Because metadata is stored alongside the object, policies can be enforced consistently regardless of where or how the data is accessed within the cloud environment.

Other storage architectures lack this flexibility. Volume and file storage focus on block-level or hierarchical file systems with limited metadata support, while relational databases require structured schemas not optimized for DRM metadata association. Object-based storage's native metadata functionality makes it the preferred architecture for enforcing content protection and rights management in the cloud.

#### NEW QUESTION # 78

Which of the following is an iterative software development methodology that focuses on achieving customer satisfaction by delivering the software early in the process and welcoming changing requirements from the customer, even late in the process?

- A. Lean
- B. Agile
- C. Waterfall
- D. Spiral

**Answer: B**

Explanation:

Agile is an iterative software development methodology designed to prioritize customer satisfaction, adaptability, and incremental delivery. Agile teams deliver small, working pieces of software frequently, ensuring feedback is incorporated throughout the process. This flexibility allows late-stage requirement changes to be accommodated without derailing the project.

Waterfall is a sequential approach with limited flexibility. Spiral combines iterative development with risk analysis, but it is not as customer-focused as Agile. Lean emphasizes efficiency and waste reduction but does not center on continuous delivery and adaptability.

Agile frameworks such as Scrum and Kanban embody this philosophy, supporting faster innovation, better collaboration, and responsiveness to evolving business needs.
