

# Realistic ZDTA Test Cram for Real Exam

## ZSCALER ZTCA/ZDTA CERTIFICATION

### PRACTICE TEST 2026 real exam!!!

Total Questions: 80+  
Time Limit: 120 Minutes  
Grade Level: Professional/Administrator

Instructions: Choose the single best answer for each question. Correct answers are highlighted in **bold** with a rationale following each section.

#### SECTION 1: ZPA ARCHITECTURE & APPLICATION SEGMENTATION (Questions 1-15)

##### Question 1

Within ZPA, the mapping relationship between Connector Groups and Server Groups can best be defined as which of the following?

- A. Server Groups are configured for Dynamic Server Discovery so that mapped Connector Groups can then DNS resolve individual application Segment Groups.
- B. Connector Groups are configured for Dynamic Server Discovery so that mapped Server Groups can DNS resolve and advertise the applications.
- C. Connector Groups are configured for Dynamic Server Discovery so that ZPA can steer traffic through the appropriate Server Group.
- D. **Server Groups are configured for Dynamic Server Discovery so that mapped Connector Groups can DNS resolve and make health checks toward the application.**

*Rationale* Dynamic Server Discovery allows the App Connectors in the mapped Connector Group to discover the servers in the Server Group via DNS and perform health checks .

##### Question 2

A server group maps \_\_\_\_\_ to \_\_\_\_\_?

- A. **App Connectors Groups to Application Segments**
- B. Applications to FQDNs
- C. FQDNs to IP Addresses
- D. Applications to Application Groups

*Rationale* Server Groups are the link between the infrastructure (App Connectors) and the configuration (Application Segments) .

##### Question 3

How do Access Policies relate to Application Segments and Application Segment Groups?

- A. When a condition is met, an Access Policy can either allow or block access to Application Segments OR Application Segment Groups.
- B. When a condition is met, an Access Policy can allow access to Application Segments Groups and block access to Application Segment.
- C. **When a condition is met, an Access Policy can either allow or block access to Application Segments and Application Segment Groups.**

BONUS!!! Download part of PrepPDF ZDTA dumps for free: [https://drive.google.com/open?id=1IgrOJQK3o4-yvfiUyItUp7\\_oKTEl8BoE](https://drive.google.com/open?id=1IgrOJQK3o4-yvfiUyItUp7_oKTEl8BoE)

The pass rate of the ZDTA exam braindumps is 98.75%, and pass guarantee and money back guarantee, if you indeed fail in the exam by using ZDTA exam dumps of us , we will refund your money or if you need to attend other exam, we will replace other 2 valid exam dumps for free. Besides, the ZDTA Exam Dumps contain both quality and certain quantity, it is good for you to practice and pass the exam successfully.

## Zscaler ZDTA Exam Syllabus Topics:

| Topic   | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Topic 1 | <ul style="list-style-type: none"><li>• Zscaler Digital Experience: This section evaluates Network Performance Analysts on their knowledge of Zscaler Digital Experience (ZDX), including understanding the ZDX score, architectural overview, features, functionalities, and practical use cases to optimize digital user experiences.</li></ul>                                                                                                                                             |
| Topic 2 | <ul style="list-style-type: none"><li>• Cyberthreat Protection Services: This domain targets Cybersecurity Analysts and covers broad cybersecurity fundamentals and advanced threat protection capabilities. Candidates must know about malware protection, intrusion prevention systems, command and control channel detection, deception technologies, identity threat detection and response, browser isolation, and incident detection and response.   Data Protection Services</li></ul> |

|         |                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Topic 3 | <ul style="list-style-type: none"> <li>• Risk Management: This domain measures skills of Risk Managers and Security Architects in using Zscaler's comprehensive risk management suite. Candidates are expected to understand risk capabilities, dashboards, asset and financial risk insights, vulnerability management, deception tactics, identity protection, and breach prediction analytics.</li> </ul> |
| Topic 4 | <ul style="list-style-type: none"> <li>• Platform Services: This section measures skills of Cloud Infrastructure Engineers and focuses on the suite of Zscaler platform services. Key topics include advanced device posture assessments, TLS inspection mechanics, and the application of policy frameworks governing internet, private access, and digital experience services.</li> </ul>                 |

## Zscaler ZDTA Latest Dumps - Affordable Price and Free Updates

In order to pass the exam and fight for a brighter future, these people who want to change themselves need to put their ingenuity and can do spirit to work. More importantly, it is necessary for these people to choose the convenient and helpful ZDTA test questions as their study tool in the next time. Because their time is not enough to prepare for the exam, and a lot of people have difficulty in preparing for the exam, so many people who want to pass the ZDTA exam and get the related certification in a short time have to pay more attention to the study materials. In addition, best practice indicates that people who have passed the ZDTA Exam would not pass the exam without the help of the ZDTA reference guide. So the study materials will be very important for all people. If you also want to pass the exam and get the related certification in a short, the good study materials are the best choice for you. Now we are going to make an introduction about the ZDTA exam prep from our company for you.

## Zscaler Digital Transformation Administrator Sample Questions (Q68-Q73):

### NEW QUESTION # 68

Which of the following refers to employees' use of unauthorized applications and services?

- A. Browser Isolation
- B. Posture Control
- C. Shadow IT
- D. Data Discovery

**Answer: C**

Explanation:

Comprehensive and Detailed 100 to 150 words of Explanation From Zscaler Digital Transformation Administrator topics: Shadow IT is the use of applications, cloud services, infrastructure, or technology that has not been authorized or formally managed by the organization, so A is correct. Employees may adopt unsanctioned file-sharing, messaging, generative AI, storage, or productivity services to complete work without security review. This creates risks involving data exposure, regulatory compliance, weak access controls, and unmanaged third- party dependencies. ZIA provides application visibility and a Shadow IT report that helps administrators identify accessed applications, evaluate their risk, and distinguish sanctioned from unsanctioned services. Browser Isolation renders web content in an isolated environment, Data Discovery identifies sensitive information, and Posture Control evaluates security conditions or weaknesses. Zscaler's data-protection guidance describes the Shadow IT report as a way to understand unauthorized application access.

### NEW QUESTION # 69

Client Connector forwarding profile determines how we want to forward the traffic to the Zscaler Cloud.

Assuming we have configured tunnels (GRE or IPSEC) from locations, what is the recommended combination for on-trusted and off-trusted options?

- A. Tunnel v2.0 for on-trusted and tunnel v2.0 for off-trusted
- B. None for on-trusted and none for off-trusted
- C. None for on-trusted and tunnel v2.0 for off-trusted
- D. Tunnel v2.0 for on-trusted and none for off-trusted

**Answer: C**

Explanation:

When trusted corporate locations already forward traffic through GRE or IPSec tunnels, Client Connector should not create a second tunnel on top of the location tunnel while the device is on the trusted network. Off trusted network, however, the client must create its own Tunnel 2.0 path to the Zero Trust Exchange. Option C (None for on-trusted and tunnel v2.0 for off-trusted) is correct because the recommended combination is None on trusted and Tunnel 2.0 off trusted.

Why the other options are incorrect:

- A). Tunnel v2.0 for on-trusted and tunnel v2.0 for off-trusted: Tunnel v2.0 on a trusted network would duplicate forwarding when GRE/IPSec tunnels already steer location traffic to Zscaler. On trusted networks, the client should not build another tunnel.
- B). None for on-trusted and none for off-trusted: None/None leaves Client Connector without tunnel forwarding on both trusted and untrusted networks. That defeats the intended traffic steering design.
- D). Tunnel v2.0 for on-trusted and none for off-trusted: Tunnel v2.0 on trusted and none off trusted reverses the desired behavior. Remote/off-trusted users need Client Connector tunneling; trusted locations already use GRE/IPSec.

#### NEW QUESTION # 70

A company must enforce least-privileged access to private applications when contractors connect from varying locations using devices with inconsistent security posture. The security team wants decisions to use identity and per-session context instead of broad network assumptions.

Which approach best meets the requirement?

- A. Prioritize ZIA URL Filtering rules that use department attributes to shape contractor access, and leave ZPA unchanged
- B. Use location groups to provide contractors with tiered access to most internal services and defer device evaluation to downstream controls
- **C. Build ZPA Access Policy rules around a SCIM-synchronized contractor group, apply device-posture conditions to sensitive application segments, and retain a final catch-all deny rule**
- D. Require session MFA for contractor authentication and use SAML attributes to relax private-application access broadly

**Answer: C**

Explanation:

Option A combines authoritative identity membership, device context, application scope, and deny-by-default enforcement. SCIM keeps the contractor group synchronized with the identity provider, while the ZPA Access Policy limits that group to specifically defined application segments. Device-posture conditions can then require an acceptable security state for each sensitive access attempt. Zscaler's SCIM Groups documentation confirms that synchronized groups can be used to enforce policy. Its Access Policy documentation lists device posture and other contextual criteria for restricting application access. URL Filtering governs internet destinations and cannot replace ZPA private-application authorization. Location- based access extends trust from the network and ignores the inconsistent endpoint posture described in the scenario. MFA strengthens authentication but does not justify broad application access; least privilege still requires narrow application entitlements and contextual policy evaluation.

#### NEW QUESTION # 71

How is the relationship between App Connector Groups and Server Groups created?

- **A. When a new Server Group is created it points to the App Connector Groups that provide visibility to this Server Group**
- B. The relationship between App Connector Groups and Server Groups is established dynamically in the Zero Trust Exchange as users try to access Applications
- C. When you create a new App Connector Group you must select the list of Server Groups to which it provides visibility
- D. Both App Connector Groups and Server Groups are linked together via the Data Center element

**Answer: A**

Explanation:

The relationship between App Connector Groups and Server Groups is configured when the Server Group is created or edited. The Server Group points to the App Connector Groups that have visibility to the applications, so ZPA knows which connectors can serve the private traffic. Option B (When a new Server Group is created it points to the App Connector Groups that provide visibility to this Server Group) is correct because Server Group configuration establishes the mapping.

Why the other options are incorrect:

- A). The relationship between App Connector Groups and Server Groups is established dynamically in the Zero Trust Exchange as users try to access Applications: A Server Group groups application servers and maps them to App Connector Groups that can

reach those servers.

C). Both App Connector Groups and Server Groups are linked together via the Data Center element: A Server Group groups application servers and maps them to App Connector Groups that can reach those servers.

D). When you create a new App Connector Group you must select the list of Server Groups to which it provides visibility: A Server Group groups application servers and maps them to App Connector Groups that can reach those servers.

### NEW QUESTION # 72

Which of the following is a feature of ITDR (Identity Threat Detection and Response)?

- A. Prevents Patient Zero Infections
- B. Blocks malicious traffic by dropping packets
- C. Reduces identity related risks
- D. Prevents connections to Embargoed Countries

**Answer: C**

Explanation:

Identity Threat Detection and Response focuses on identity risk, particularly in directory environments such as Active Directory. To evaluate AD objects, relationships, permissions, and risky identity configurations, ITDR needs directory-level data rather than raw packet captures or firewall summaries. Option B (Reduces identity related risks) is correct because LDAP queries are the standard mechanism for collecting structured AD domain information for identity-risk analysis.

Why the other options are incorrect:

A). Prevents Patient Zero Infections: Patient Zero prevention is malware-first prevention. ITDR reduces identity risk by finding credential, privilege, and directory exposures.

C). Prevents connections to Embargoed Countries: Embargoed-country blocking is geo/access policy. ITDR is focused on identity threats, not destination-country filtering.

D). Blocks malicious traffic by dropping packets: Dropping packets is firewall/IPS behavior. ITDR analyzes identities and permissions rather than acting as a packet filter.

### NEW QUESTION # 73

.....

Today, the IT industry is facing fierce competition, you will feel powerless, this is inevitable. All you have to do is to escort your career. Of course, you have many choices. I recommend that you use the PrepPDF Zscaler ZDTA Exam Questions And Answers, it is a good helper to help your success of IT certification. So what you still waiting for, go to get new PrepPDF Zscaler ZDTA exam training materials early.
