

Workday Workday-Adaptive-Planning認定テキスト & Workday-Adaptive-Planning模擬体験

あなたは自分のWorkdayのWorkday-Adaptive-Planning試験を準備する足りない時間または探せない権威的な資料に心配するなら、この記事を見て安心できます。我々Fast2testの提供するWorkdayのWorkday-Adaptive-Planningの復習資料はあなたを助けて一番短い時間であなたに試験に合格させることができます。我々は権威的な試験資料と豊富な経験と責任感のあるチームを持っています。我々のすべての努力はあなたにWorkdayのWorkday-Adaptive-Planning試験に合格させるためです。

お客様のさまざまなニーズを満たすために、当社の専門家と教授は、PDFバージョン、オンラインバージョン、ソフトウェアバージョンなど、お客様が選択できるWorkday-Adaptive-Planning試験問題の3つの異なるバージョンを設計しました。次に、Workday-Adaptive-Planning学習ガイドのオンラインバージョンを紹介します。オンライン版の最大の利点は、このバージョンがすべてのエレクトロニカ機器をサポートできることです。Workday-Adaptive-Planning学習教材のオンラインバージョンを選択した場合、エレクトロニカ機器で当社の製品を使用できます。

試験の準備方法-最高のWorkday-Adaptive-Planning認定テキスト試験-信頼できるWorkday-Adaptive-Planning模擬体験

たぶん、あなたは苦しく準備してWorkdayのWorkday-Adaptive-Planning試験に合格できないのを心配しています。おそらくあなたはお金がかかって買ったソフトが役に立たないのを心配しています。我々Fast2testのあなたに開発するWorkdayのWorkday-Adaptive-Planningソフトはあなたの問題を解決することができます。最初の保障はあなたに安心させる高い通過率で、第二の保護手段は、あなたは弊社のソフトを利用してWorkdayのWorkday-Adaptive-Planning試験に合格しないなら、我々はあなたのすべての支払を払い戻します。あなたが安心して試験のために準備すればいいです。

Workday Pro Adaptive Planning Certification Exam 認定 Workday-Adaptive-Planning 試験問題 (Q56-Q61):

質問 # 56

How do you navigate from the Welcome page to the Assumption accounts configuration page?

- A. Global Navigation menu > Modeling > Model Management > Accounts > Assumptions
- B. Global Navigation menu > Modeling > Model Overview > Accounts > Assumptions
- C. Global Navigation menu > Administration
- D. Global Navigation menu > Assumptions

正解: A

解説:

In Workday Adaptive Planning, Assumption accounts are configured within the Model Management section of the Modeling area. The precise navigation path is: Global Navigation menu > Modeling > Model Management > Accounts > Assumptions. Within Accounts, the system presents different account type categories, including GL Accounts, Metric Accounts, and Assumption Accounts. Selecting Assumptions allows administrators to create, edit, and manage global Assumption accounts that store planning constants such as inflation rates, tax rates, and other shared variables. The Administration path leads to user management and system settings - not model configuration. There is no direct 'Assumptions' link in the Global Navigation menu. The 'Model Overview'

submenu does not contain the Accounts configuration; Model Overview provides a structural summary of the model. Model Management > Accounts is the authoritative path for all account type configurations, including Assumptions. Reference: Workday Adaptive Planning - Modeling Navigation, Model Management, Assumption Account Setup.

質問 # 57

You have a Rates cube sheet at the Year time stratum holding various assumptions and percentages. If you want to reference accounts in this cube sheet elsewhere, what design consideration is required?

- A. Monthly inputs for Rates can still load and aggregate to Year.
- B. Only sheets at the Year time stratum can reference Rates accounts.
- C. The Rates sheet will perform automatic breakback to months.
- **D. Reference to Rates accounts need the [time=this.year] modifier.**

正解: D

解説:

In Workday Adaptive Planning, when a cube sheet is configured at the Year time stratum, all data stored in that sheet exists at the annual level - not at monthly periods. When formulas on monthly sheets or other sheets reference accounts from this year-stratum Rates cube sheet, the reference must include the [time=this.year] modifier to correctly resolve the time dimension. Without this modifier, a monthly formula attempting to reference a year-stratum account may return zero or an error because the system cannot automatically match a monthly time context to an annual data point. The [time=this.year] modifier explicitly instructs the formula to retrieve the annual value corresponding to the year in which the current period falls. Automatic breakback does not apply to formula references from external sheets. Monthly inputs cannot aggregate to a year-stratum cube sheet - data must be entered at the year level. Reference across different time strata require explicit time modifiers to ensure correct data retrieval. Reference: Workday Adaptive Planning - Cube Sheet Time Stratum, Cross-Sheet Reference, [time=this.year] Modifier.

質問 # 58

A rollup account called Total Operating Expenses aggregates the balance of the child accounts called Salaries and Rent. If the Rent account is removed from the Adaptive Planning model, what will be the immediate impact on the formula and data?

- A. The formula and data will be automatically reassigned to the rollup account, Total Operating Expenses.
- **B. The formula and data will be permanently deleted across all versions and levels.**
- C. The formula and data will be preserved within an archived leaf account in the system.
- D. The formula and data will be automatically transferred to the remaining child account, Salaries.

正解: B

解説:

In Workday Adaptive Planning, when an account is deleted from the model, all associated formulas and data stored in that account are permanently and irreversibly deleted across all versions and all levels. There is no automatic transfer, reassignment, or archiving mechanism. The system does not migrate data to sibling accounts or parent rollups upon deletion. This is a critical and irreversible action - once the Rent account is removed, its historical actuals, plan data, and any formulas are permanently lost from the model. This behavior underscores the importance of data backup and version control before performing structural changes. Administrators should export or archive data before deleting accounts. The rollup account Total Operating Expenses will continue to function but will now only aggregate the remaining child, Salaries. Any reports or dashboards referencing the deleted Rent account will return errors or blank values. 質問 # 59

How can you report on alternate level groupings within Adaptive Planning that reflect the ones maintained in a financial system of record such as Workday?

- A. Include the existing levels within a new level rollup that includes 'Alternate' in the name and code.
- B. Select the box 'For reporting purposes only' within Level Details on the alternate parent rollup.
- **C. Use level dimensions or level attributes to represent the alternate hierarchy structure.**
- D. Suggest a change in the system of record to only have one single structure matching the Adaptive Planning one.

正解: C

解説:

Workday Adaptive Planning supports alternate reporting hierarchies through the use of level dimensions and level attributes, which allow users to tag and classify levels according to groupings that exist in external systems of record such as Workday HCM or Workday Financial Management. This approach preserves the primary level hierarchy while enabling reporting along alternate dimensional structures without restructuring the core model. Level dimensions enable slice-and-dice reporting across dimensions that cross-cut the standard hierarchy, while level attributes allow metadata tagging of individual levels for grouping in reports and dashboards. Neither modifying the system of record nor creating parallel rollup structures represents a maintainable or scalable solution. The 'For reporting purposes only' checkbox applies to specific use cases but does not comprehensively support alternate hierarchy reporting across the model. Level dimensions and attributes are the recognized, official design pattern for multi-hierarchy reporting in Adaptive Planning. Reference: Workday Adaptive Planning - Level Attributes, Level Dimensions, Alternate Hierarchies, Reporting Configuration.

質問 # 60

Which two exchange rate types does a new Adaptive Planning instance create by default?

- A. Actuals and Plan
- B. Historical and Budget
- C. Average and End of Month
- D. Local and Corporate

正解: C

解説:

When a new Workday Adaptive Planning instance is initialized, the system automatically creates two default exchange rate types: Average and End of Month. The Average rate is typically used for translating income statement accounts (revenues and expenses), where the average exchange rate over a period better represents the economic reality of ongoing transactions. The End of Month rate is used for translating balance sheet accounts (assets, liabilities, equity), where the closing rate at period end reflects the current value of those balances. These two rate types correspond directly to standard financial accounting currency translation methodologies mandated by accounting standards such as ASC 830 and IAS 21. Historical and Budget rates are additional types that can be created manually but are not default system-generated types. Local and Corporate refer to currency designations, not exchange rate types. Actuals and Plan refer to version types. The Average and End of Month defaults align Adaptive Planning with standard multi-currency financial reporting requirements out of the box. Reference: Workday Adaptive Planning - Currency Setup, Exchange Rate Types, Multi-Currency Configuration.
