Topic 2	<ul style="list-style-type: none"> <li>• Develop collaborative Terraform workflows: In this section, candidates are tested for their skills related to managing the Terraform binary, providers, and modules using version constraints and setting up remote states. It also covers the utilization of the Terraform workflow in automation.</li> </ul>
Topic 3	<ul style="list-style-type: none"> <li>• Collaborate on infrastructure as code using HCP Terraform: In this section, the topics covered include analyzing the HCP Terraform run workflow, the role of HCP Terraform workspaces and their configuration options, and the management of provider credentials in HCP Terraform.</li> </ul>
Topic 4	<ul style="list-style-type: none"> <li>• Manage resource lifecycle: The section covers topics such as Initializing a configuration using terraform init and its options and generating an execution plan using terraform plan and its options. It also covers the configuration changes using Terraform Apply and its options.</li> </ul>

## HashiCorp Certified: Terraform Associate (003) (HCTA0-003) Sample Questions (Q236-Q241):

### NEW QUESTION # 236

terraform init retrieves and caches the configuration for all remote modules.

- A. False
- B. True

**Answer: A**

Explanation:

terraform init retrieves and caches providers and modules, but only for explicitly declared modules in the configuration.

\* If a module is added or updated, terraform init needs to be re-run to download the new version.

\* Terraform does not automatically cache all remote modules unless they are explicitly referenced in the configuration.

Official Terraform Documentation Reference:

terraform init - HashiCorp Documentation

### NEW QUESTION # 237

Which of the following command would be use to access all of the attributes and details of a resource managed by Terraform?

- A. Terraform state show ' provider\_type\_name
- B. Terraform state list provider\_type\_name
- C. Terraform get provider\_type\_name
- D. Terraform state list

**Answer: A**

Explanation:

This is the command that you would use to access all of the attributes and details of a resource managed by Terraform, by providing the resource address as an argument. For example, terraform state show 'aws\_instance.example' will show you all the information about the AWS instance named example.

### NEW QUESTION # 238

A developer on your team is going to tear down an existing deployment managed by Terraform and deploy a new one. However, there is a server resource named aws\_instance.ubuntu[] they would like to keep. What command should they use to tell Terraform to stop managing that specific resource?

- A. Terraform apply rmaws\_instance.ubuntu[1]
- B. Terraform destroy rmaws\_instance.ubuntu[1]
- C. Terraform plan rmaws\_instance.ubuntu[1]
- **D. Terraform state rmaws\_instance.ubuntu[1]**

**Answer: D**

Explanation:

To tell Terraform to stop managing a specific resource without destroying it, you can use the terraform state rm command. This command will remove the resource from the Terraform state, which means that Terraform will no longer track or update the corresponding remote object. However, the object will still exist in the remote system and you can later use terraform import to start managing it again in a different configuration or workspace. The syntax for this command is terraform state rm <address>, where <address> is the resource address that identifies the resource instance to remove. For example, terraform state rm aws\_instance.ubuntu[1] will remove the second instance of the aws\_instance resource named ubuntu from the state. References = :  
Command: state rm : Moving Resources

### NEW QUESTION # 239

How can terraform plan aid in the development process?

- A. Formats your Terraform configuration files
- **B. Validates your expectations against the execution plan without permanently modifying state**
- C. Reconciles Terraform's state against deployed resources and permanently modifies state using the current status of deployed resources
- D. Initializes your working directory containing your Terraform configuration files

**Answer: B**

Explanation:

The terraform plan command is used to create an execution plan. It allows you to see what actions Terraform will take to reach the desired state defined in your configuration files. It evaluates the current state and configuration, showing a detailed outline of the resources that will be created, updated, or destroyed. This is a critical step in the development process as it helps you verify that the changes you are about to apply will perform as expected, without actually modifying any state or infrastructure.

Terraform documentation on terraform plan: Terraform Plan

### NEW QUESTION # 240

How is terraform import run?

- A. As a part of terraform refresh
- B. All of the above
- C. As a part of terraform init
- **D. By an explicit call**
- E. As a part of terraform plan

**Answer: D**

Explanation:

Explanation

The terraform import command is not part of any other Terraform workflow. It must be explicitly invoked by the user with the appropriate arguments, such as the resource address and the ID of the existing infrastructure to import. References = [Importing Infrastructure]

### NEW QUESTION # 241

.....

Yet at any moment, competition is everywhere so you may be out of work or be challenged by others at any time.
