## CrowdStrike Certified Cloud Specialist Sample Questions (Q21-Q26):

### NEW QUESTION # 21

What is the recommended method to block a specific CVE for 14 days when creating an Image assessment policy exclusion?

- A. Vulnerability ID & Exclude until 14 days
- B. Vulnerable ID & Exclude indefinitely

- C. Packages published recently until 14 days
- D. Vulnerabilities published recently until 14 days

**Answer: A**

Explanation:

When creating an Image Assessment policy exclusion in CrowdStrike Falcon Cloud Security, the recommended and most precise method to temporarily suppress a specific CVE is Vulnerability ID & Exclude until 14 days.

This approach allows security teams to explicitly reference a known CVE (for example, CVE-2024-XXXX) and suppress enforcement for a defined time window. The 14-day exclusion period is commonly used to allow development teams time to rebuild images, validate patches, or address dependency constraints without permanently weakening security posture.

Broad exclusions based on recently published vulnerabilities or packages can unintentionally suppress unrelated risk and increase exposure. Indefinite exclusions are discouraged unless there is a strong, documented business justification.

CrowdStrike documentation and best practices emphasize time-bound, CVE-specific exclusions to balance operational flexibility with security rigor. Therefore, the correct and recommended option is Vulnerability ID & Exclude until 14 days.

#### NEW QUESTION # 22

Which feature of CrowdStrike Falcon Cloud Security helps detect misconfigured cloud settings that can lead to data exposure?

- A. Fusion Workflows
- **B. CSPM**
- C. Runtime Protection
- D. Sensor Update Policy

**Answer: B**

#### NEW QUESTION # 23

You must share remediation recommendations for an IOM in Falcon Cloud Security.

What information found within the IOM Remediation link will help your team address the misconfiguration?

- **A. Related documentation from the cloud provider**
- B. Total number of misconfigurations found for the related IOM policy
- C. Severity of the misconfiguration

**Answer: A**

Explanation:

The IOM Remediation link in Falcon Cloud Security provides cloud-provider-specific remediation guidance, which is the most actionable information for addressing misconfigurations. This includes direct links to official documentation from providers such as AWS, Azure, or GCP that explain the correct configuration steps and security implications.

While severity and finding counts help with prioritization, they do not tell teams how to fix the issue. Cloud provider documentation ensures remediation actions are accurate, supported, and aligned with native platform best practices.

CrowdStrike intentionally includes these links to reduce friction between security and cloud operations teams, enabling faster and more reliable remediation. Therefore, the correct answer is Related documentation from the cloud provider.

#### NEW QUESTION # 24

What criteria can you use to create exclusions for cloud scans?

- A. Service
- **B. Tag**
- C. Region
- D. Account

**Answer: B**

Explanation:

In CrowdStrike Falcon Cloud Security, exclusions for cloud scans are designed to be precise and scalable so that organizations can

safely reduce noise without weakening overall security coverage. According to CrowdStrike best practices, tags are the recommended and supported criterion for creating cloud scan exclusions.

Tags are metadata labels applied to cloud resources (such as AWS accounts, instances, or services) and are commonly used for ownership, environment classification (for example, dev, test, or prod), or application grouping. By using tags as exclusion criteria, security teams can dynamically control which resources are excluded from scans without relying on static identifiers. This is especially important in cloud environments where resources are frequently created, modified, or terminated.

Exclusions based on accounts, regions, or services are broader in scope and can unintentionally exclude large portions of the environment, increasing the risk of blind spots. Tag-based exclusions allow CrowdStrike Falcon to maintain least-privilege security principles by excluding only explicitly labeled resources.

Because Falcon continuously evaluates cloud resources, tag-based exclusions automatically apply to newly created assets that inherit the same tag, ensuring consistent policy enforcement. For these reasons, CrowdStrike documentation and operational guidance identify tags as the correct and most effective criterion for creating cloud scan exclusions.

### NEW QUESTION # 25

During an audit of your organization's CrowdStrike Identity Analyzer configuration, you find several policies related to cloud service access.

Which of the following represents a misconfiguration that needs immediate remediation?

- A. A policy that provides specific permissions for developers to deploy services within staging environments.
- **B. A policy that allows all users to create and delete resources in production environments.**
- C. A policy that explicitly denies access to sensitive resources for unauthorized roles.
- D. A policy that provides read-only access to database services for analysts.

**Answer: B**

Explanation:

Option A: Denying access to sensitive resources for unauthorized roles enhances security and ensures that users cannot access resources they are not entitled to.

Option B: Read-only access aligns with least privilege, ensuring analysts can view data without modifying it. This is a correctly configured policy.

Option C: This misconfiguration grants excessive privileges to all users, violating the principle of least privilege and increasing the risk of accidental or intentional misuse. Access to production environments should be tightly controlled and limited to specific, authorized roles.

Option D: Granting developers permissions tailored to their role in a non-production environment aligns with best practices and does not pose a security risk.
