Salesforce Salesforce-MuleSoft-Developer-I Exam Syllabus Topics:

Topic	Details
Topic 1	Routing Events: It focuses on using the Choice router for conditional logic and the Scatter-Gather router to multicast events. This topic also involves validating data by using the Validation module.
Topic 2	Creating Application Networks: The topic of creating Application Networks encompasses understanding MuleSoft's proposal for closing the IT delivery gap and describing the role and characteristics of the modern API. It also includes the purpose and roles of a Center for Enablement (C4E), and the benefits of API-led.

Topic 3	Handling Errors: Handling errors includes describing default error handling in Mule applications and defining custom global default error handlers. It involves comparing On Error Continue and On Error Propagate scopes, creating error handlers for a flow, using the Try scope, and mapping errors to custom application errors.
Topic 4	Deploying and Managing APIs and Integrations: It includes packaging Mule applications for deployment and deploying them to CloudHub. This topic also involves using CloudHub properties, creating and deploying API proxies, connecting an API implementation to API Manager, and applying policies to secure an API.
Topic 5	Building API Implementation Interfaces: This topic involves manually creating a RESTful interface for a Mule application and generating a REST Connector from a RAML specification. It also includes describing the features and benefits of APIkit.
Topic 6	Using Connectors: It focuses on retrieving data from REST services using HTTP Request or REST Connector. Moreover, the topic covers using a Web Service Consumer connector for SOAP web services and the Transform Message component.
Topic 7	Processing Records: Processing records includes methods for processing individual records in a collection and explaining how Mule events are processed by the For Each scope. It also involves using the Batch Job with Batch Steps and a Batch Aggregator.
Topic 8	Transforming Data with DataWeave: It involves writing DataWeave scripts and using DataWeave functions. This topic also includes defining and using DataWeave variables, functions, and modules, and applying correct syntax.
Topic 9	Structuring Mule Applications: Structuring Mule applications covers parameterizing an application and defining and reusing global configurations. It includes breaking an application into multiple flows using private flows, subflows, and the Flow Reference component.
Topic 10	Designing APIs: Designing APIs involves describing the lifecycle of the modern API and using RAML to define various aspects of an API. It includes identifying when to use query parameters vs URI parameters, and defining API parameters.
Topic 11	Accessing and Modifying Mule Events: It describes the Mule event data structure. Moreover, the topic focuses on usage of transformers and enriching Mule events.

Salesforce Certified MuleSoft Developer (Mule-Dev-201) Sample Questions (Q222-Q227):

NEW QUESTION # 222

Refer to the exhibits.

The Mule Application is being debugged in Anypoint Studio and stops at breakpoint. What is the value of payload displayed in debugger at this breakpoint?

- A. Finished
- B. Processing

- C. Begin

Answer: C

NEW QUESTION # 223

Refer to the exhibits.

The Mule application implements a REST API that accepts GET requests from web clients on the URLs: `http://acme.com/order/status` and `http://acme.com/customer/status`.

What path value can be set in the HTTP GET event source to accept web client requests from both of these URLs?

- A. `*status`
- B. `?[order,customer]/status`
- C. `*/status`
- D. `*[order,customer]/status`

Answer: C

NEW QUESTION # 224

Refer

to the exhibits. A web client submits a request to `http://localhost:8081/flights?destination=SFO` and the Web Service Consumer throws a `WSC:BAD_REQUEST` error.

What is the next step to fix this error?

- A. set a SOAP payload before the Consume operation that contains the destination query parameter
- B. set a property in the Consume operation equal to the destination query parameter
- C. Set a header in the Consume operation equal to the destination query parameter
- D. set a JSON payload before the Consume operation that contains the destination query parameter

Answer: A

Explanation:

As can be seen in error message, SOAP service `findFlights` expects the SOAP payload. This can be set using transform message processor which forms SOAP payload before the Consume operation that contains the destination query parameter

NEW QUESTION # 225

Refer to the exhibit.

What can be added to the flow to persist data across different flow executions?

- A. properties of the Mule runtime app object
- B. Properties of the Mule runtime flow object
- C. session variables
- D. Key/value pairs in the ObjectStore

Answer: D

Explanation:

An object store is a facility for storing objects in or across Mule applications. Mule runtime engine (Mule) uses object stores to persist data for eventual retrieval. Internally, Mule uses object stores in various filters, routers, and other message processors that need to store states between messages.

Object stores are available in all deployment targets. If you deploy your application to CloudHub, you can also use Object Store V2.

Correct answer is Key/value pair in Object store

MuleSoft Documentation reference : <https://docs.mulesoft.com/mule-runtime/4.3/mule-object-stores#use-cases>

NEW QUESTION # 226

Refer to the exhibit.

□ The main flow contains a Flow Reference for the child flow.
 What values are accessible in the child flow after a web client submits a request to <http://localhost:8Q81/order? color=red?>

- A. payload
quantity var color query param
- B. payload
- C. payload
quantity var
- D. payload
color query param

Answer: A

Explanation:

Flow Reference Component

Flow Reference routes the Mule event to another flow or subflow, executes all processors in the referenced flow, and then routes the event back within the same Mule application. The following diagram shows the order of processing when one flow references another:

□ When the main flow is triggered, the Mule event travels through and executes the flow until the event reaches the Flow Reference. The event then travels through and executes the referenced flow from beginning to end, and then returns to the main flow.

This process enables you to treat the entire referenced flow like a single component in your current flow.

Mule Ref Doc : <https://docs.mulesoft.com/mule-runtime/4.3/flowref-about> Correct answer is payload quantity var color query param
