Cisco Supporting Cisco Devices for Field Technicians Sample Questions (Q99-Q104):

NEW QUESTION # 99

Which command is used to determine if there is sufficient space in the memory of a device before installing a new Cisco IOS image?

- A. show storage
- B. show memory
- C. show file-system
- D. show flash:

Answer: D

Explanation:

The show flash: command is used to display the contents of the device's flash memory, which is where the Cisco IOS image is typically stored. By issuing this command, a technician can verify available space and determine whether there is enough capacity to accommodate a new IOS image before initiating an upgrade or image replacement process.

This command provides a detailed listing of files, their sizes, and the total and available memory space within the flash file system.

show file-system lists all available file systems but doesn't detail their content.

show memory shows runtime memory usage (RAM), not flash memory.

show storage is not a standard IOS command.

NEW QUESTION # 100

Drag and drop the steps of the boot sequence process of a Cisco device into order on the right.

Answer:

Explanation:

□ Explanation:

Step 1 # Performs power-on self-test (POST)

Step 2 # Loads and runs bootstrap code (firmware)

Step 3 # Finds and loads the Cisco IOS software

Step 4 # Finds and loads the configuration

Step 5 # Runs the configured Cisco IOS software

This startup process is thoroughly described in the FLDTEC course and aligns with Cisco's standard IOS boot process:

* POST (Power-On Self-Test): Verifies hardware functionality including memory and interfaces. This occurs immediately upon powering the device.

* Bootstrap Code Execution: Bootstrap is a small program in ROM that initiates the boot process.

* Cisco IOS Loading: Bootstrap locates and loads the IOS from flash memory or another source (e.g., TFTP).

* Configuration Loading: The router then loads the startup-config from NVRAM (if available).

* IOS Execution: Once the configuration is loaded, the device enters operational mode and executes the IOS with the loaded config. This sequence is vital for field technicians to understand for troubleshooting boot failures or performing device recoveries.

NEW QUESTION # 101

Which type of license is locally managed and does not require external tools for management?

- A. Hybrid licenses
- **B. RTU licenses**
- C. PAK licenses
- D. Smart licenses

Answer: B

Explanation:

Right-To-Use (RTU) licenses are locally managed licenses that allow users to activate specific features on Cisco devices without the need for external tools or connectivity to Cisco's licensing infrastructure. These licenses operate on an honor-based system, where the user agrees to comply with the licensing terms without mandatory enforcement mechanisms.

In contrast:

* Hybrid licenses combine aspects of traditional and smart licensing models.

* PAK (Product Authorization Key) licenses require registration and activation through Cisco's licensing portal.

* Smart licenses necessitate communication with Cisco's Smart Licensing servers for activation and management.

NEW QUESTION # 102

Which term describes the physical range of radio frequency coverage provided by an access point in a wireless topology?

- A. Wireless LAN Controller (WLC)
- B. Service Set Identifier (SSID)
- **C. Basic Service Area (BSA)**
- D. Wireless LAN (WLAN)

Answer: C

Explanation:

In wireless networking, the Basic Service Area (BSA) refers to the physical area of radio frequency coverage provided by an access point (AP) in a Basic Service Set (BSS). The BSA defines the coverage area where wireless clients can connect to the network through the AP. The size and shape of a BSA depend on various factors, including the AP's transmit power, antenna type, and physical environment.

Option A, the Service Set Identifier (SSID), is the network name broadcast by the AP. Option C, Wireless LAN (WLAN), refers to the overall wireless network. Option D, Wireless LAN Controller (WLC), is a device that manages multiple APs in a network.

NEW QUESTION # 103

Which protocol should be analyzed when troubleshooting call quality between IP phones?

- A. H.323
- B. SIP
- C. SCCP
- **D. RTP**
- E. 323: An older protocol suite for multimedia communication, encompassing both signaling and media, but less commonly used in modern IP telephony. Reference: Supporting Cisco Devices for Field Technicians (FLDTEC) - Troubleshooting Methodologie

Answer: D

Explanation:

When addressing call quality issues between IP phones, the Real-time Transport Protocol (RTP) is the primary protocol to analyze. RTP is responsible for the actual transmission of voice data during a call, and its performance directly impacts call quality.

Key factors affecting RTP and, consequently, call quality include:

Packet Loss: Missing packets can lead to audio gaps.

Jitter: Variations in packet arrival times can cause choppy audio.

Latency: Delays in packet delivery can result in noticeable lag.

Analyzing RTP streams allows technicians to identify these issues and implement appropriate Quality of Service (QoS) measures to mitigate them.

In contrast:

SIP (Session Initiation Protocol): Handles call setup, modification, and teardown but not the media stream.

SCCP (Skinny Client Control Protocol): A Cisco proprietary protocol for signaling, not media transport.
