UiPath certification UiPath-ADAv1 exam is one of the many IT employees' most wanting to participate in the certification exams. Passing the exam needs rich knowledge and experience. While accumulating these abundant knowledge and experience needs a lot of time. Maybe you can choose some training courses or training tool and spending a certain amount of money to select a high quality training institution's training program is worthwhile. GetValidTest is a website which can meet the needs of many IT employees who participate in UiPath Certification UiPath-ADAv1 Exam. GetValidTest's product is a targeted training program providing for UiPath certification UiPath-ADAv1 exams, which can make you master a lot of IT professional knowledge in a short time and then let you have a good preparation for UiPath certification UiPath-ADAv1 exam.

If you want to get a comprehensive idea about our real UiPath-ADAv1 study materials, you can free download the demos on our website. It is convenient for you to download the free demos of our UiPath-ADAv1 learning guide, all you need to do is just to find the "Download for free" item, and you will find there are three kinds of versions of UiPath-ADAv1 Learning Materials for you to choose from namely, PDF Version Demo, PC Test Engine and Online Test Engine, you can choose to download any one as you like.

Valid UiPath-ADAv1 Test Simulator, UiPath-ADAv1 Trustworthy Exam Content

The system of UiPath-ADAv1 study materials is very smooth and you don't need to spend a lot of time installing it. We take into account all aspects on the UiPath-ADAv1 exam braindumps and save you as much time as possible. After the installation is complete, you can devote all of your time to studying UiPath-ADAv1 Exam Questions. And a lot of our worthy customers always praise the high-efficiency of our UiPath-ADAv1 learning guide. If you buy it, i guess you will love it as well.

UiPath Automation Developer Associate v1 Exam Sample Questions (Q119-Q124):

NEW QUESTION # 119

A developer used a dictionary to store employee ID numbers as the key with associated employee surnames as the value What is the benefit of using a dictionary?

- A. Dictionaries can have repeated keys
- B. Dictionaries can be searched by keys or values
- C. Dictionaries must have unique values
- D. Dictionary keys and values can be of different data types

Answer: D

Explanation:

The benefit of using a dictionary is that dictionary keys and values can be of different data types. A dictionary is a collection of key-value pairs, where each key is associated with a value. The key and the value can be of any data type, such as String, Integer, Boolean, Object, etc. This allows for more flexibility and versatility in storing and retrieving data³. For example, a dictionary can store employee ID numbers as the key with associated employee surnames as the value, where the key is of type Integer and the value is of type String. To access the value of a specific key, the syntax dictionaryName(key) can be used⁴. References: Dictionaries and How to use dictionary? from UiPath documentation and forum.

NEW QUESTION # 120

Where can the UiPath Robot logs be stored for centralized access and analysis?

- A. UiPath Orchestrator.
- B. Microsoft Excel files.
- C. Directly into a database.
- D. Local text files only.

Answer: A

Explanation:

UiPath Robot logs capture execution details such as start time, end time, errors, warnings, and info messages. These logs help in monitoring, debugging, and auditing automation performance.

Where Are Logs Stored?

* By Default:

* Local text files (for debugging in AppData\Local\UiPath\Logs).

* For Centralized Access:

* UiPath Orchestrator (Best Practice) - Allows enterprise-level monitoring and analysis.

* For Advanced Logging:

* Database (Connected via Orchestrator SQL storage).

* Custom Logging (Splunk, ElasticSearch, etc.) via UiPath Log Monitoring integration.

Why Other Options Are Incorrect?

* A (Directly into a database) #

* Logs are not stored directly into a database; instead, Orchestrator manages the logs and stores them in its connected SQL database.

* B (Local text files only) #

* Logs are stored locally by default, but this is not centralized access.

* C (Microsoft Excel files) #

* UiPath does not log directly into Excel files; however, logs can be exported to Excel manually.

References:

- * UiPath Logging Documentation
- * UiPath Orchestrator Log Management

NEW QUESTION # 121

Which of the following statements is true about unattended automations?

- **A. Unattended automations are suited to processes that perform privileged operations, requiring elevated permissions and credentials.**
- B. Unattended automations require a human to provide credentials for the used applications and log out when the process is finished.
- C. Unattended automations run under human supervision and require input at some points in the process.
- D. Unattended automations are best suited for smaller, more fragmented tasks that run on the user's machine.

Answer: A

Explanation:

Unattended automation is designed to run without human intervention and is typically deployed in server environments or virtual machines.

* Why Option D is Correct:

* Unattended robots handle background automation that requires elevated permissions and credentials.

* Credentials are securely stored in UiPath Orchestrator Assets, meaning no manual login is required.

* Use Case: Running scheduled tasks, back-office operations, and enterprise-level automation.

* Why Other Options Are Incorrect:

* A: # Incorrect - Unattended bots do not require a human to log in or provide credentials manually.

* B: # Incorrect - Supervision is not needed; Unattended automation executes independently.

* C: # Incorrect - Unattended automation is not for small, fragmented tasks but enterprise- scale operations.

NEW QUESTION # 122

A developer wants to map the arguments that pass data to and from GenerateUserID.xaml to the appropriate values in Main.xaml.

The dt_Users datatable variable contains the columns First Name, Last Name, Date of Birth, and Username.

Instructions: From the Value drop-down lists shown in the following exhibit, select the correct variable that corresponds to each argument.

Sequence

For Each Row in Data Table

ForEach In
 CurrentRow dt_Users

Body

Invoke GenerateUserID workflow

Workflow file name
 "GenerateUserID.xaml"

Import Arguments 2 Open Workflow

Invoked workflow's arguments

Name	Direction	Type	Value
in_Username	In	String	
out_UserID	Out	Int32	
Create Argument			

Name	Variable type	Scope	Default
dt_Users	DataTable	Sequence	Enter a VB expression
UserID	Int32	Sequence	Enter a VB expression
Usernames	String[]	Sequence	Enter a VB expression

Variables Arguments Imports

Sequence

For Each Row in Data Table

ForEach In
 CurrentRow dt_Users

Body

Invoke GenerateUserID workflow

Workflow file name
 "GenerateUserID.xaml"

Import Arguments 2 Open Workflow

Invoked workflow's arguments

Name	Direction	Type	Value
in_Username	In	String	CurrentRow("Username").ToString dt_Users.Rows(0).Item("Username").ToString UserID Usernames
out_UserID	Out	Int32	CurrentRow("Username").ToString dt_Users.Rows(0).Item("Username").ToString UserID Usernames
Create Argument			

Name	Variable type	Scope	Default
dt_Users	DataTable	Sequence	Enter a VB expression
UserID	Int32	Sequence	Enter a VB expression
Usernames	String[]	Sequence	Enter a VB expression

Variables Arguments Imports

Answer:

Explanation:

The screenshot displays the configuration for an 'Invoke GenerateUserID workflow' activity. The 'Workflow file name' is set to 'GenerateUserID.xaml'. The 'Import Arguments' section shows two arguments: 'in_Username' (In, String) and 'out_UserID' (Out, Int32). The 'Value' column for 'in_Username' contains the expression 'CurrentUser("Username").ToString' and for 'out_UserID' it contains 'dt_Users.Rows(0).Item("Username").ToString'. Below this, a table lists the variables used in the workflow:

Name	Variable type	Scope	Default
dt_Users	DataTable	Sequence	Enter a VB expression
UserID	Int32	Sequence	Enter a VB expression
Usernames	String[]	Sequence	Enter a VB expression

Explanation:

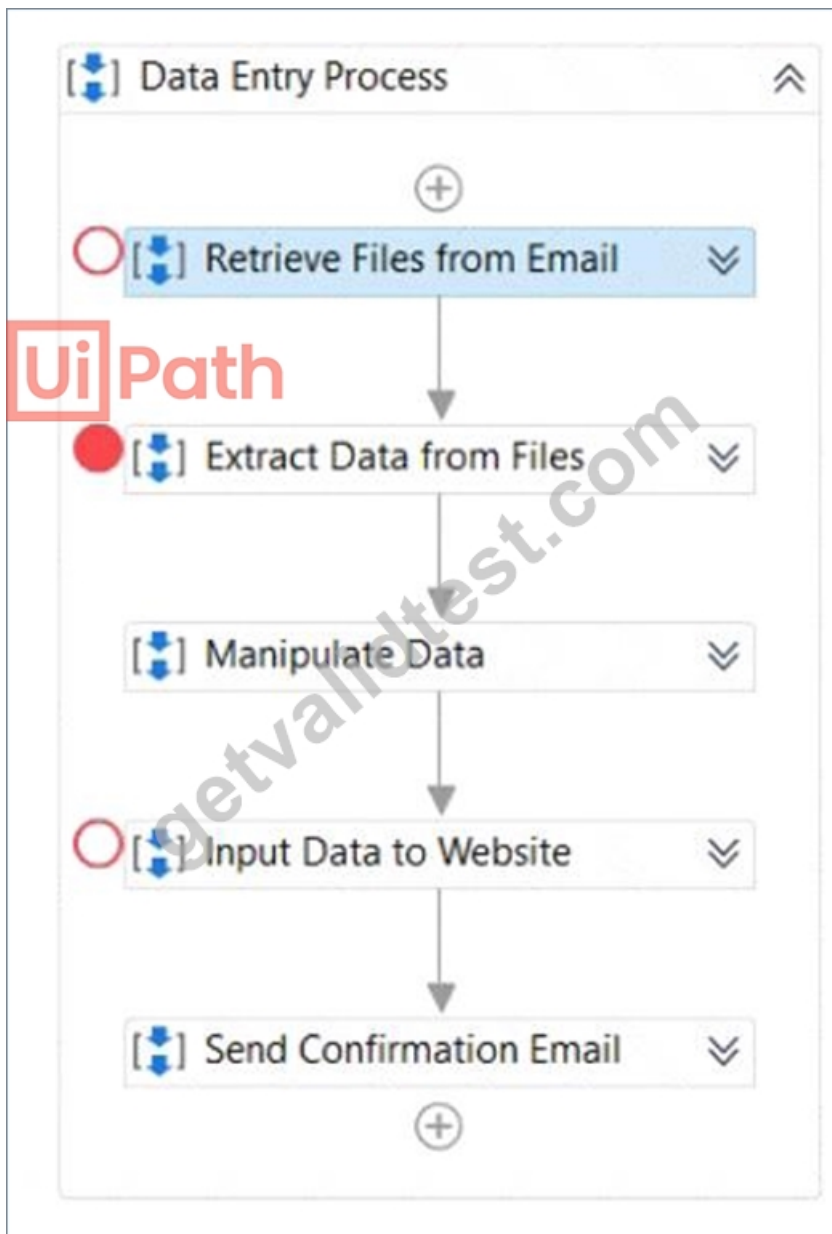

The values to select from the drop-down lists for the in_Username and Out_UserID arguments are:

- * in_Username: CurrentRow("Username").ToString
- * Out_UserID: UserID

These values will ensure that the in_Username argument receives the value of the Username column from the current row of the dt_Users datatable, and the Out_UserID argument returns the value of the UserID variable that is generated by the GenerateUserID.xaml workflow.

NEW QUESTION # 123

A developer executes the following workflow in Debug mode with "Continue on Exception" enabled.

How many times will the workflow pause the execution?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: C

Explanation:

The workflow will pause the execution only once when it is executed in Debug mode with "Continue on Exception" enabled. Debug mode is a mode of execution that allows the developer to test and troubleshoot the workflow by using various debugging tools, such as breakpoints, step actions, and output messages⁴. "Continue on Exception" is a debugging option that enables the execution to continue even if an exception is encountered, without displaying the error message or stopping at the faulty activity⁵. In the workflow, there are two activities that can throw exceptions: the "Throw" activity, which throws a custom exception with the message "This is an exception", and the "Write Line" activity, which writes the value of the "Var" variable to the Output panel. The "Var" variable is not initialized, so it has a null value by default.

When the "Write Line" activity tries to write the null value, it throws a `NullReferenceException`, as explained in the previous question. However, since the "Continue on Exception" option is enabled, the execution does not stop at the "Write Line" activity, but continues to the next activity, which is the "Throw" activity. The

"Throw" activity throws the custom exception, which is caught by the "Catch" section of the "Try Catch" activity. The "Catch" section contains a "Log Message" activity, which writes the exception message to the Output panel. The execution then moves to the "Finally" section, which contains a "Write Line" activity with the text "This is the end". The workflow then ends successfully. The only

time the execution pauses is when it reaches the breakpoint that is set at the "Throw" activity. A breakpoint is a debugging tool that allows the developer to pause the execution at a specific activity and inspect the values of the variables and arguments, as well as the output messages⁶. The developer can then resume the execution by using the step actions or the continue button⁷. Therefore, the workflow will pause the execution only once at the breakpoint, and not at the exceptions, as they are ignored by the "Continue on Exception" option. References: Debugging a Workflow, Debugging Actions, Breakpoints, and Continue on Exception from UiPath documentation.

NEW QUESTION # 124

.....

For candidates who will attend an exam, some practice for it is necessary. UiPath-ADAv1 Exam Dumps of us will give you the practice you need. UiPath-ADAv1 exam dumps of us contain the knowledge point of the exam. Skilled professionals will verify the questions and answers, which will guarantee the correctness. Besides, we also offer you free update for one year after purchasing, and the update version will send to your email address automatically.
