Fortinet EMEA Advanced Support Exam Sample Questions (Q35-Q40):

NEW QUESTION # 35
What does the FortiGate 'set nat enable' command do in a firewall policy?

- A. Disables NAT for the policy
- B. Enables NAT for outgoing traffic
- C. Enables NAT for incoming traffic only
- D. Forces NAT to use a specific IP pool

Answer: B

Explanation:
The 'set nat enable' command in a FortiGate firewall policy enables Source NAT (SNAT) for outgoing traffic, typically rewriting the source IP to the FortiGate's interface IP or an IP pool. It does not disable NAT (B), force a specific pool (C), or limit to incoming traffic (D). Exact extract: "The 'set nat enable' command in a firewall policy enables Source NAT, rewriting the source IP address of outgoing traffic to the egress interface IP or a configured NAT pool."

NEW QUESTION # 36

What tool would you use to verify a certificate?

- A. OpenSSL
- B. Certtester
- C. Hping
- D. Nessus

Answer: A

Explanation:
OpenSSL is a widely used command-line tool for verifying certificates, checking validity, chains, and details like subject, issuer, and expiration. It is supported in Fortinet troubleshooting and certificate management.
Nessus is for vulnerability scanning, Hping for packet crafting, Certtester is not standard. Exact extract:
Description. This article describes how to verify by OpenSSL if the format of the certificate is correct when getting an error message like ... How to verifying the Certificate by CA Certificate on openssl command. You can verify the certificate's validity by CA certificate. Example 1: ... Navigate to System -> Certificate -> Create/Import. Select Import Certificate -> Select Type Certificate. Upload server.pem. Upload ca.key.
Description, This article describes how to sign and generate certificates using OpenSSL in Windows OS that can be used for SSL VPN and IPSec VPN ... This section discusses the following tasks you can perform on the System > Certificate > Manage Certificates page.

NEW QUESTION # 37
Which of these BGP paths will be the preferred one ?

- A. Prefer the path with the highest Local Preference value
- B. Prefer the path with the lowest Multi-Exit Discriminator (MED)
- C. Prefer External path (learned via EBGP) over Internal path (IBGP)
- D. Prefer the path with the shortest AS Path

Answer: A

Explanation:
BGP path selection follows a specific order of attributes to determine the best path. The process prefers the path with the highest local preference first, as it is one of the earliest steps in the decision process. Local preference is used within an AS to influence outbound traffic. Only if local preferences are equal does it move to the next criteria, such as shortest AS path. The AS path length is considered after local preference, MED after that, and eBGP over iBGP even later. Therefore, among the options, the highest local preference (D) is the most preferred criterion. The original document's answer B is incorrect based on standard BGP selection rules implemented in Fortinet. Exact extract: This article describes the BGP route selection process. Scope FortiGate. Solution Consider only routes with no AS loops and a valid next hop. BGP makes routing decisions based on path, network policies and rulesets ... select the route with the lowest router ID as the best path. Network. Type. To achieve this, multiple route selection techniques can be used. Some are protocol- agnostic (for example, weight) and others are protocol-specific (for example ...).

NEW QUESTION # 38
Which FortiGate feature allows inspection of encrypted SSL/TLS traffic?

- A. Web Filtering
- B. Application Control
- C. Deep Packet Inspection
- D. SSL Inspection

Answer: D

Explanation:
FortiGate's SSL Inspection feature decrypts and inspects SSL/TLS traffic to detect threats or enforce policies, using techniques like full SSL inspection or certificate inspection. Deep Packet Inspection (A) is a broader term, Application Control (C) identifies apps, and Web Filtering (D) blocks URLs, not specific to SSL. Exact extract: "SSL Inspection allows FortiGate to decrypt and inspect SSL/TLS traffic to detect hidden threats or enforce security policies, supporting full or certificate-based inspection."

NEW QUESTION # 39

Which term refers to the OSPF router that connects area 0 to a nonbackbone area?

- A. autonomous system boundary router
- B. backbone router
- C. area border router
- D. area boundary router

Answer: C

Explanation:

The standard term in OSPF for a router connecting the backbone area (Area 0) to a non-backbone area is "area border router" (ABR). It maintains separate LSDBs for each area and performs summarization. "Area boundary router" is similar but not the standard term; ASBR connects to external AS; backbone router is in Area 0. Exact extract: Go to Network > OSPF. Set Router ID to 10.11.101.1. In the Areas table, click Create New and set the following: Area ID. 0.0. Click OK. In the Networks ... A router connected to more than one area is an area border router (ABR). An autonomous system boundary router (ASBR) is located between an OSPF autonomous ... This article describes the basic steps to configure FortiGates in an OSPF scenario where the FortiGates will be ABR and ASBR OSPF routers across 3 areas. OSPF areas are groupings of OSPF routers or logical parts of a network. An area's routing information can be sent as a summary to other areas. This article describes that routes learned from the other OSPF areas will be removed on the ABR router when it has multiple areas and has no backbone ...
