## Salesforce Certified MuleSoft Integration Foundations Sample Questions (Q13-Q18):

### NEW QUESTION # 13

An organization is choosing between API-led connectivity and other integration approaches.

- A. Greater project predictability through tight coupling of systems
- **B. Increased developer productivity through self-service of API assets**
- C. Higher outcome repeatability through centralized development
- D. Improved security through adoption of monolithic architectures

**Answer: B**

Explanation:

The Value Proposition: A primary goal of API-led connectivity is to close the IT delivery gap. It achieves this by turning APIs into reusable Assets published to Exchange. 8 Self-Service: When assets are discoverable, other developers (e.g., Line of Business developers) can reuse them without waiting for central IT to build everything from scratch. This "Self-Service" model significantly increases overall developer productivity.

Why others are incorrect:

Tight Coupling (B): API-led promotes loose coupling. Tight coupling makes systems brittle and hard to change (Point-to-Point).

Centralized Development (C): Creates a bottleneck. API-led enables federated development.

Monolithic (D): API-led breaks monoliths into composable services (Microservices/APIs).

### NEW QUESTION # 14

According to MuleSoft, which system integration term describes the method, format, and protocol used for communication between two systems? 4

- A. Component
- **B. Interface**
- C. Interaction
- D. Message

**Answer: B**

Explanation:

Comprehensive and Detailed Explanation:

The Interface: In system integration and MuleSoft terminology, the Interface is the contract that defines how two systems communicate. It specifies:

Protocol: How data is transmitted (e.g., HTTP, FTP, AMQP).

Format: The structure of the data (e.g., JSON, XML, CSV).

Method: The specific action (e.g., GET, POST).

Why other options are incorrect:

Message: This refers to the actual data payload (the content) being sent, not the rules of communication.

Component: This usually refers to a specific building block within the Mule flow (like a Logger or a Database connector) or a software module, not the communication definition itself.

Interaction: This describes the act of communicating, not the definition of the standard used.

### NEW QUESTION # 15

An organization's IT team must secure all of the internal APIs within an integration solution by using an API proxy to apply required authentication and authorization policies.

- A. Integration Platform-as-a-Service (IPaaS)
- B. Electronic Data Interchange (EDI)
- **C. API Management (APIM)**
- D. Robotic Process Automation (RPA)

**Answer: C**

Explanation:

API Management (APIM): This category of software capability focuses on the Governance, Security, and Lifecycle of APIs. 7 The Role of the Proxy: In MuleSoft's API Manager (the APIM component), you create an API Proxy. This proxy sits in front of the backend API implementation. It intercepts incoming requests, checks security policies (like Client ID enforcement or OAuth 2.0), and only forwards valid requests to the backend.

Why others are incorrect:

iPaaS: Refers to the integration/building platform (connecting systems), though modern platforms like Anypoint combine both iPaaS and APIM. The specific act of securing via proxy is an APIM function.

EDI: Standard for B2B document exchange (like Purchase Orders).

RPA: Automating manual tasks on UI screens.

### NEW QUESTION # 16

Which Anypoint Platform component should a MuleSoft developer use to create an API specification prior to building the API implementation?

- A. API Manager
- B. MDint (Likely typo in PDF, refers to MUnit or similar tools)
- C. Runtime Manager
- D. API Designer

**Answer: D**

Explanation:

Design-First Approach: The lifecycle starts with Design.

API Designer: This is the web-based tool within Design Center where developers write the API contract using RAML (RESTful API Modeling Language) or OAS (OpenAPI Specification). 9 Functionality: It provides syntax highlighting, error checking, and a "Mocking Service" that allows you to test the API's behavior before writing any actual code.

Why others are incorrect:

API Manager: Used after design to manage policies and gateways.

Runtime Manager: Used after build to deploy the application.

### NEW QUESTION # 17

A platform architect includes both an API gateway and a service mesh in the architecture of a distributed application for communication management.

- A. Between the application and external API implementations
- B. Between application services and the firewall
- C. Between services within the application
- D. Between the application and external API clients

**Answer: C**

Explanation:

Service Mesh vs. API Gateway:

API Gateway: Typically manages North-South traffic (traffic entering the application network from external clients).

Service Mesh: Is designed to manage East-West traffic (traffic flowing between microservices within the application network or cluster).

Anypoint Service Mesh: It manages, secures, and observes communication between services within the application (microservices), ensuring zero-trust security and policy enforcement inside the Kubernetes cluster.
