NEW QUESTION # 280

Due to a drug-drug interaction, patients taking tetracycline should avoid simultaneous use of:

- A. decongestants that contain pseudoephedrine.
- B. antacids that contain calcium.
- C. antitussives that contain dextromethorphan.
- D. analgesics that contain acetaminophen.

Answer: B

Explanation:

Tetracyclines, including doxycycline and minocycline, are broad-spectrum antibiotics used to treat bacterial infections. They have a major drug-drug interaction with calcium-containing antacids and other minerals.

* Chelation Effect: Calcium binds to tetracycline, forming insoluble complexes that prevent the antibiotic from being absorbed in the gastrointestinal (GI) tract.

* Reduced Efficacy: Because the drug cannot be absorbed, the antibiotic's effectiveness is significantly reduced.

* Similar Interactions: Magnesium, iron, and aluminum (found in many antacids, dairy products, and multivitamins) also reduce tetracycline absorption.

- * Take on an Empty Stomach(1 hour before or 2 hours after meals).
 - * Avoid Dairy, Antacids, and Multivitamins for at least 2 hours before and after taking tetracycline.
 - * Drink with a Full Glass of Water to prevent esophageal irritation.
 - * B. Decongestants that contain pseudoephedrine.# Incorrect. Pseudoephedrine does not interact with tetracycline.
 - * C. Antitussives that contain dextromethorphan.# Incorrect. Dextromethorphan does not affect tetracycline absorption.
 - * D. Analgesics that contain acetaminophen.# Incorrect. Acetaminophen does not bind to tetracycline or impact its absorption.
 - * Lexicomp Drug Interaction Database - Tetracycline and Calcium Interactions.
