---

As for candidates who possessed with a 2V0-15.25 professional certification are more competitive. The current word is a stage of science and technology, social media and social networking has already become a popular means of 2V0-15.25 exam materials. As a result, more and more people study or prepare for exam through social networking. By this way, our 2V0-15.25 learning guide can be your best learn partner. The pass rate of our 2V0-15.25 exam questions is high as 99% to 100%, and it is a wise choice to have our 2V0-15.25 training guide.

## VMware 2V0-15.25 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>VMware by Broadcom Solution: This section focuses on understanding VMware by Broadcom's virtualization and cloud infrastructure platform for managing modern enterprise workloads.</li></ul>
Topic 2	<ul style="list-style-type: none"><li>Troubleshoot and Optimize the VMware by Broadcom Solution: This domain focuses on troubleshooting VCF deployment, upgrades, conversions, workload domains, fleet operations (certificates, passwords, identity), licensing, compute resources, storage (vSAN, supplemental storage), networking (VDS, NSX), VCF Operations tools, Identity Broker automation, and HCX workload migrations.</li></ul>

Topic 3	<ul style="list-style-type: none"> <li>IT Architectures, Technologies, Standards: This domain covers fundamental frameworks, tools, and best practices for building scalable, secure, and interoperable enterprise IT systems.</li> </ul>
Topic 4	<ul style="list-style-type: none"> <li>Plan and Design the VMware by Broadcom Solution: This domain addresses architectural planning and design principles for creating scalable, secure virtual environments aligned with business requirements.</li> </ul>
Topic 5	<ul style="list-style-type: none"> <li>Install, Configure, Administrate the VMware by Broadcom Solution: This area covers installing, configuring, and managing VMware solutions including VCF Fleet deployment, expansion, and reduction operations.</li> </ul>

## 2V0-15.25 Latest Torrent, 2V0-15.25 Review Guide

The contents of our 2V0-15.25 study materials are all compiled by industry experts based on the examination outlines and industry development trends over the years. 2V0-15.25 exam guide is not simply a patchwork of test questions, but has its own system and levels of hierarchy, which can make users improve effectively. Our 2V0-15.25 Study Materials contain test papers prepared by examination specialists according to the characteristics and scope of different subjects. And if you study with our 2V0-15.25 exam questions, you are bound to pass the 2V0-15.25 exam.

## VMware Cloud Foundation 9.0 Support Sample Questions (Q10-Q15):

### NEW QUESTION # 10

An administrator creates a tag for a virtual machine (VM) in VMware Cloud Foundation (VCF) Operations.

When assigning the tag to the virtual machine In vCenter, the tag was not found.

What is the cause of this error?

- A. The tag was not pushed to the vCenter instance.
- B. The tag was not pushed to Custom Groups.
- C. The vCenter version is incorrect.
- D. VM Tools is not installed.

**Answer: A**

Explanation:

In VMware Cloud Foundation 9.0 Operations, tags created inside VCF Operations do not automatically appear in vCenter. Tags must be explicitly synchronized ("pushed") to the selected vCenter instance before they become usable for VM tagging within vCenter. This is because VCF Operations maintains its own metadata store for tags, super metrics, groups, and policies.

The correct workflow is:

- \* Create the tag in VCF Operations.
- \* Push (synchronize) the tag to the appropriate vCenter instance.
- \* The tag then appears in vCenter's Tags & Custom Attributes section.
- \* Administrators can then assign the tag to VMs.

If the push step is skipped, the tag exists only inside VCF Operations and cannot be referenced by vCenter, which is exactly the symptom described: tag not found when attempting to assign it to a VM.

Option A is incorrect because Custom Groups do not affect vCenter tag visibility.

Option B is incorrect because tag synchronization is not tied to a specific vCenter version as long as the vCenter is officially supported by VCF 9.x.

Option D is irrelevant-VMware Tools has nothing to do with tag visibility.

### NEW QUESTION # 11

An administrator has successfully created a new Organization for All Apps In VMware Cloud Foundation (VCF) Automation.

When logging into the new organization using the first user account, only the Overview tab is visible.

What is a possible cause of this issue?

- A. The first user account was assigned the Organization Auditor Role.
- **B. The first user account was assigned the Organization User Role.**
- C. The first user account was assigned the Organization Administrator Role.
- D. The first user account was assigned a Custom Role.

**Answer: B**

Explanation:

This issue stems from an incorrect role assignment during the user creation process in VMware Cloud Director (VCF Automation).

Organization Administrator Role (Option D): This role grants full control, including visibility of the Administration tab (to manage users, groups, and settings), Data Centers, and Monitor tabs. If the user were an Admin, they would see all tabs.

Organization Auditor Role (Option A): This is a read-only role, but by definition, an Auditor can view anything an Organization Administrator can see (including the Administration settings), just without edit rights. Therefore, an Auditor would still see the Administration tab.

Organization User Role (Option B): This is a consumer-level role designed for deploying and managing vApps. By default, this role does not have access to the Administration tab or high-level organization settings.

If the organization is new and has no vApps or VDCs populated yet, a user with this role might see a very restricted view (effectively just a dashboard or "Overview") because they lack the rights to see the administrative configuration menus.

Conclusion: The fact that the "Administration" tab is missing (implied by "only Overview is visible") identifies the user as an Organization User (or a restricted Custom Role) rather than an Administrator or Auditor.

**NEW QUESTION # 12**

An administrator is troubleshooting a problem with NSX.

Which command can be used to validate installed NSX VIBs on the ESX host?

- **A. esxcli software vib list**
- B. esxtop -b -d 2 -n 100
- C. nsxcli get version
- D. esxcfg software list

**Answer: A**

Explanation:

When troubleshooting NSX on an ESXi host, VMware requires verification that NSX VIBs (vSphere Installation Bundles) are installed and in the correct state. VIBs are responsible for NSX datapath, control-plane modules, and kernel extensions on ESXi.

The authoritative and documented method to list VIBs on an ESXi host is the command:

`esxcli software vib list`

This command displays all installed kernel modules, version numbers, NSX packages, and their installation status. For NSX-T (now part of VCF networking), administrators expect to see VIBs such as nsx-agservice, nsx-bridge, nsx-esx-datapath, and others. If any required NSX VIBs are missing or inconsistent, the ESXi host will fail to join NSX transport nodes or will show "Not Ready."

Option A (esxtop) is for performance monitoring and does not show VIB information.

Option C (nsxcli get version) checks NSX version on Edge Nodes or host transport nodes but does not list VIBs.

Option D (esxcfg software list) is an outdated and invalid command.

**NEW QUESTION # 13**

An administrator is attempting to log into the vCenter using the vSphere Client but receives an error stating "no healthy upstream" What are two possible causes for this? (Choose two.)

- A. The vmware-rbd-watchdog service is not running.
- B. The administrator logged in with the root account.
- **C. The SSO Service is not running.**
- **D. The vpxd service is not running.**
- E. Port 443 is not opened between the local machine and the vCenter.

**Answer: C,D**

Explanation:

The vSphere Client "no healthy upstream" error is a classic indicator that one or more vCenter backend services are not running or responding, preventing the reverse proxy layer (envoy / nginx) from routing requests to the appropriate upstream services.

Two services in particular are known root causes:

A). vpxd service not running

vpxd is the core vCenter Server service responsible for inventory, host management, and client interaction. If vpxd is stopped, crashed, or restarting, the vSphere Client cannot communicate with backend APIs, resulting in the "no healthy upstream" condition.

B). SSO (vmware-stsd / identity service) not running

Authentication in vCenter depends on the SSO/Identity service. If SSO is unavailable, login sessions cannot be validated, and vCenter marks the upstream service as unhealthy.

Other options do not match the behavior:

\* C (Port 443 closed) would produce a connection failure, not the upstream error.

\* D (logging in with root) is fully supported and does not trigger this message.

\* E (vmware-rbd-watchdog) relates to backup/restore health, not core authentication/management planes.

## NEW QUESTION # 14

An administrator has created an alarm for an object in VMware Cloud Foundation (VCF) Operations. The alert does not show up in the alert pane despite being configured on the object.

Parameters:

\* Symptom definition: Read Latency (ms) is higher than 1 ms.

\* Alert definition: Alert is triggered as soon as the latency is higher than the 1 ms defined in the symptom definition.

\* Object type: Virtual Machine.

What is the reason the alert does not show up in the alert view?

- A. The alert is not enabled in the policy.
- B. The administrator is missing the privileges to view alerts for this object.
- C. The metric used in the symptom definition does not apply to this object type.
- D. This type of alert must be forwarded from VMware Cloud Foundation Operations for Logs.

**Answer: A**

Explanation:

In VMware Cloud Foundation 9.0, VCF Operations (vROps-based) uses policies to control which alerts, symptoms, and metrics are evaluated for a given object. Creating an alert definition and symptom alone is not sufficient; the alert must be associated with and enabled in a policy that is actively applied to the target object (in this case, a Virtual Machine). The documentation shows that when you create an alert definition, there is an explicitPolicies step, where you select the policy (for example, the default policy) so that the alert becomes active for objects governed by that policy.

The metric "Read Latency (ms)" is valid for virtual-machine-related objects: VCF Operations documents Read Latency metrics at the VM disk and VM-datastore link level (for Disk and Datastore metrics on Virtual Machines). Therefore, option B (metric not applicable) is incorrect. No requirement exists that such a performance alert must be forwarded from VCF Operations for Logs (D); log-based alerts are a separate alert type.

If the alert definition is not enabled in the effective policy for that VM, VCF Operations will not evaluate the symptom or generate the alert, and it will not appear in the alert pane—even though the definition technically exists. This matches option C exactly.

## NEW QUESTION # 15

.....

All purchases at Actual4Cert are protected by PayPal system which is the most reliable payment system all over the world. So when you buy VMware 2V0-15.25 exam dumps, you won't worry about any leakage or mistakes during the deal. Actual4Cert puts customers' interest and VMware 2V0-15.25 products quality of the first place. We will never tell your personal information to the third party without your permission. So you can feel 100% safe knowing that the credit-card information you enter into the order form is 100% secure.
