## (SRE) Pass-Sure Latest Exam Price

The profession of our experts is expressed in our DevOps-SRE training prep thoroughly. They are great help to catch on the real knowledge of DevOps-SRE exam and give you an unforgettable experience. Do not miss this little benefit we offer for we give some discounts on our DevOps-SRE Exam Questions from time to time though the price of our DevOps-SRE study guide is already favourable. And every detail of our DevOps-SRE learning braindumps is perfect!

The PeopleCert DevOps-SRE Certification Exam is a globally recognized certification that is highly valued by employers and organizations. It is designed to provide professionals with the knowledge and skills they need to excel in their careers and make a real impact in the field of DevOps and SRE. PeopleCert DevOps Site Reliability Engineer (SRE) certification exam is also a great way for professionals to demonstrate their expertise and commitment to the field.

## Peoplecert PeopleCert DevOps Site Reliability Engineer (SRE) Sample Questions (Q22-Q27):

### NEW QUESTION # 22

Which scenario BEST illustrates the swarming concept used during incident management?

- A. A group of specialist teams meet and review a queue of escalated incidents to determine who should work on which one
- B. A mid-level support team continually monitors escalated incidents to assign teams to ensure they are making progress
- C. An incident analyst route escalates by assessing a consolidated list of next-level support teams and their area of expertise
- D. A high-level specialist support team constantly reviews their incoming incident queue to respond instantly to escalations

**Answer: A**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Swarming is described in modern SRE incident management as a collaborative, multi-expert response model.

Instead of linear escalation, SRE uses: "a rapid collaboration of the right experts at the same time to resolve incidents quickly." (SRE Workbook - Effective Incident Response). Swarming pulls specialists together immediately, allowing them to jointly triage and work on issues, improving time-to-resolution and reducing handoff delays.

Option D captures this: multiple specialist teams coming together simultaneously to determine ownership and action.

Option A describes traditional tiered escalation, which SRE avoids.

Option B represents a reactive queue model, not swarming.

Option C focuses on monitoring progress, not active collaborative response.

Thus, D is correct.

### NEW QUESTION # 23

Which of the following BEST describe the characteristics of a product team?

- \* They are small and collaborative
- \* They have cross-functional skillsets
- \* They do not share responsibilities
- \* They discourage any feedback

- A. 1 and 2
- B. 2 and 3
- C. 1 and 4
- D. 3 and 4

**Answer: A**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Modern SRE-aligned organizations use small, cross-functional product teams capable of owning design, development, testing, and operational reliability. The SRE Book emphasizes: "Effective service ownership arises from small, autonomous teams with diverse skillsets and strong collaboration habits." These teams share responsibility, encourage feedback, and maintain open communication to meet reliability goals.

Option A correctly identifies the two positive characteristics:

- \* Small and collaborative
- \* Cross-functional skillsets

Options 3 and 4 represent dysfunctional behaviors-SRE literature explicitly discourages responsibility silos and discouraging feedback, as these reduce reliability and slow incident learning.

Thus, A is the correct answer.

#### NEW QUESTION # 24

Which of the following BEST describes the capabilities and scope of DevOps continuous monitoring?

- A. The deployment of a set of integrated monitoring tools and event thresholds for infrastructure
- B. The application of widespread system event monitoring by automating the end user transactions
- C. The combination of tools and the process for a rapid incident detection and response of cloud services
- D. The use of multiple monitoring tools and an event management process for all applications

Answer: A

#### NEW QUESTION # 25

Why is observability potentially better than traditional monitoring?

- A. Traditional monitoring does not adapt well to the cloud since it focuses on discrete components and applications
- B. Traditional monitoring can struggle to scale when service growth is rapid
- C. Traditional monitoring cannot support containers
- D. Observability is less expensive than traditional monitoring

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Traditional monitoring works well when systems are static and predictable. However, cloud-native, distributed, and microservice-based architectures create highly dynamic environments. In these cases, observability becomes more effective because it provides visibility across entire systems, rather than focusing on individual components.

From Google's Observability guidance:

"Traditional monitoring relies on predefined dashboards and known failure modes. In modern cloud systems, component-level monitoring becomes insufficient because failures occur in ways that cannot always be predicted." Further, in the SRE Workbook:

"Monitoring individual components does not provide adequate visibility into complex distributed systems.

Observability enables teams to understand system-wide behavior and user impact." Why options are incorrect:

\* A Observability is not inherently cheaper.

\* C While true, it is not the best reason; observability's benefit is broader than scale alone.

\* D Traditional monitoring can support containers but often becomes noisy and ineffective.

Thus, the best answer is B.

#### NEW QUESTION # 26

Which of the following BEST defines a Service Level Indicator (SLI)?

- A. A subjective assessment of the performance aspects of the level of service required
- B. A subjective measure of the consequences if the level of service is not achieved
- C. A quantitative measure of some aspect of the level of service that is provided
- D. A quantitative target value for aspects of the level of service that are provided

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Google's definition is explicit: "An SLI is a carefully defined QUANTITATIVE measure of some aspect of the level of service provided." (SRE Book - Chapter: Service Level Objectives). Examples include error rate, latency, throughput, and availability. SLIs are measurements, not targets-targets are SLOs.

Option D repeats Google's definition almost exactly.

Option C incorrectly describes an SLO (a target), not an SLI.

Options A and B mention subjective assessments-SRE explicitly rejects subjectivity in measurement, stating: "SLIs must be objective and measurable." Thus, D is the correct and SRE-authentic answer.
