Veeam Certified Engineer v12 Sample Questions (Q46-Q51):

NEW QUESTION # 46

Veeam Backup & Replication is currently configured to keep backups for 14 days on a NAS repository. An engineer needs to enable GFS with 12 monthly and 5 yearly full backups to extend the retention for archival purposes but does not have enough space on the repository to store them.

After adding the repository to Scale-Out-Backup Repository (SOBR) as Performance Tier, which option should the engineer choose to solve this issue?

- A. Add an Object Storage as Capacity tier and set the policy to copy backups to object storage as soon as they are created
- B. Add an Object Storage as Archive tier and set the policy to move all GFS backups
- **C. Add an Object Storage as Capacity tier and set the policy to move backups older than 14 days**
- D. Add another NAS repository as Capacity tier and set the policy to move backups older than 14 days

Answer: C

Explanation:

To solve the space issue while enabling GFS retention, the engineer should add an Object Storage as a Capacity tier to the Scale-Out Backup Repository (SOBR) and set the policy to move backups that are older than 14 days. This approach allows for efficient use of local NAS storage for short-term retention and leverages object storage for long-term archival purposes. NEW QUESTION # 47

An infrastructure with 50 VMs has a power outage. After the VMware cluster has booted up again, 10 large VMs are orphaned. However, all VM disk files are still on the datastores. What is the quickest way to bring back those VMs with the least possible data loss?

- A. Remove the existing VM disk files from the datastore and perform Instant VM Recovery.
- B. Use the "Restore guest files" option to restore the VM configuration files.
- C. Perform Instant VM Recovery with quick rollback with automatic Power On VM at the end.
- **D. Perform Restore VM Files and only restore the VM configuration files.**

Answer: D

Explanation:

Explanation

By performing a restore of only the VM configuration files, you can quickly recreate the VM in VMware vSphere using the existing disk files on the datastore. This method avoids the need to transfer or copy large VM disk files, resulting in a faster restoration process. Note that this method assumes that the VM disk files are still intact on the datastore. If any of the VM disk files are missing or corrupted, you may need to consider alternative restoration methods or perform a full restore from the Veeam backup files.

NEW QUESTION # 48

Which of the following is a unique feature that allows Veeam Cloud Service Providers to offer backup and replication services to customers?

- A. Veeam Archive Services
- **B. Veeam Cloud Connect**
- C. Veeam Cloud Scale-out Repository
- D. Veeam Data Vault

Answer: B

Explanation:

Veeam Cloud Connect is a unique feature that enables Veeam Cloud Service Providers to offer backup and replication services to their customers. It provides a secure and seamless way to extend on-premises backups and replicas to the cloud using an encrypted connection, without requiring a VPN. This feature is specifically designed to simplify off-site backup and disaster recovery solutions for customers leveraging a service provider's infrastructure.

NEW QUESTION # 49

What is a Recovery Point Objective (RPO) in regards to disaster recovery?

- A. The total cost associated with recovering a system
- B. The maximum amount of time it takes to restore a system
- C. The number of recovery points created during the backup process
- **D. The acceptable data loss measured in time that can be tolerated**

Answer: D

Explanation:

In the context of disaster recovery, the Recovery Point Objective (RPO) is best defined by option B:

The acceptable data loss measured in time that can be tolerated. RPO is a critical metric in disaster recovery and business continuity planning that specifies the maximum amount of data (measured in time) that an organization can afford to lose in the event of a disaster or system failure. It effectively sets the limit for how frequently data backups or replications should occur.

For instance, an RPO of 4 hours means that the organization must be able to recover data from no more than 4 hours prior to the disaster, implying that backup or replication operations should occur at least every 4 hours. Establishing an RPO is essential for developing an effective data protection strategy, as it guides the choice of backup methodologies and technologies to meet the organization's tolerance for data loss.

NEW QUESTION # 50

An engineer wants to make sure that a single SQL Database can be recovered in a consistent manner with an RPO that will offer the least impact on the production environment during production hours. Granular restores should be performed with the Veeam console as the company does not have a DBA and is not using SQL Management Studio (SSMS).

The engineer took the following steps:

- * Created a separate job for the MS SQL VMs
- * At guest processing, enabled application-aware processing and provide the credentials with sufficient permissions
- * Schedule the job to run every 24 hours

Which other change can the engineer make for this job to achieve the proposed goals?

- A. Set the backup job to perform recovery using Veeam Explorer for SQL
- **B. Schedule transaction log processing every 30 minutes**
- C. Remove the VM and add only the SQL Databases in the job
- D. Schedule the job to run every 30 minutes

Answer: B

Explanation:

To achieve the goal of recovering a single SQL Database in a consistent manner with minimal impact on the production environment during production hours, while allowing for granular restores through the Veeam console, the engineer should A: Schedule transaction log processing every 30 minutes. By enabling application-aware processing for the SQL VM and scheduling the main backup job to run every 24 hours, the base image of the SQL database is protected. However, to achieve a more granular Recovery Point Objective (RPO) and ensure the ability to restore to specific points in time, transaction log backups must be performed more frequently. Configuring the backup job to process transaction logs every 30 minutes captures the SQL database changes more frequently without the overhead of a full backup, allowing for point-in-time restores directly from the Veeam console without the need for SQL Management Studio (SSMS) or a Database Administrator (DBA). This setup aligns with the goals of maintaining operational efficiency and minimizing the impact on production while ensuring robust data protection capabilities.
