Salesforce Certified MuleSoft Integration Foundations Sample Questions (Q33-Q38):

NEW QUESTION # 33

According to MuleSoft's API development best practices, which type of API development approach starts with writing and approving an API contract?

- A. Implement-first
- B. Design-first
- C. Agile
- D. Catalyst

Answer: B

Explanation:

Design-First: This approach dictates that the API Contract (the Specification, e.g., RAML/OAS) must be written, reviewed, and approved before any implementation code is written.

The Contract: The "Contract" serves as the agreement between the API provider and the consumer.

Why others are incorrect:

Implement-first: You write the code (Mule flows) first, and the contract is generated from the code (or ignored).

Catalyst: Is a broader delivery methodology, not specifically the "Contract-first" technical approach.

NEW QUESTION # 34

A MuleSoft developer must implement an API as a Mule application, run the application locally, and execute unit tests against the running application.

- A. API Manager
- B. API Designer
- C. Anypoint CLI
- D. Anypoint Studio

Answer: D

Explanation:

Anypoint Studio: This is the desktop Integrated Development Environment (IDE) for MuleSoft.

Capabilities:

Implement: It provides the graphical interface to drag-and-drop connectors and configure flows.

Run Locally: It includes an embedded Mule Runtime engine, allowing developers to run and debug apps on their own machines.
Execute Unit Tests: It has MUnit fully integrated, allowing developers to run tests and see coverage reports directly in the IDE.
Why others are incorrect:
API Designer: Web-based tool for designing specs (RAML), not implementing logic or running local runtimes.
Anypoint CLI: Command-line tool for platform operations, not development/testing.

NEW QUESTION # 35

What is an example of data confidentiality?

- A. De-masking a person's Social Security number while inserting it into a database
- **B. Encrypting a file containing personally identifiable information (PII)**
- C. Providing a server's private key to a client for secure decryption of data during a two-way SSL handshake
- D. Signing a file digitally and sending it using a file transfer mechanism

Answer: B

Explanation:

Confidentiality: This security concept ensures that information is not made available or disclosed to unauthorized individuals, entities, or processes.

Encryption (Option A): Transforming readable data (plaintext) into unreadable data (ciphertext) is the primary technical control for confidentiality. 7 If a file with PII is stolen but encrypted, the confidentiality is maintained 8 9. 10 Why others are incorrect:

Signing (C): Ensures Integrity (proving the data hasn't changed), not confidentiality (the data is still readable).

De-masking (B): Removes protection.

Providing Private Key (D): This is a severe security breach, not a protection mechanism.

NEW QUESTION # 36

An organization is choosing between API-led connectivity and other integration approaches.

- A. Improved security through adoption of monolithic architectures
- B. Greater project predictability through tight coupling of systems
- C. Higher outcome repeatability through centralized development
- **D. Increased developer productivity through self-service of API assets**

Answer: D

Explanation:

The Value Proposition: A primary goal of API-led connectivity is to close the IT delivery gap. It achieves this by turning APIs into reusable Assets published to Exchange. 8 Self-Service: When assets are discoverable, other developers (e.g., Line of Business developers) can reuse them without waiting for central IT to build everything from scratch. This "Self-Service" model significantly increases overall developer productivity.

Why others are incorrect:

Tight Coupling (B): API-led promotes loose coupling. Tight coupling makes systems brittle and hard to change (Point-to-Point).

Centralized Development (C): Creates a bottleneck. API-led enables federated development.

Monolithic (D): API-led breaks monoliths into composable services (Microservices/APIs).

NEW QUESTION # 37

A developer needs to discover which API specifications have been created within the organization before starting a new project.

- A. API Manager
- B. Object Store 2
- C. Runtime Manager
- **D. Anypoint Exchange**

Answer: D

Explanation:

4

Anypoint Exchange: This is the central repository and knowledge base of the Anypoint Platform. It is designed specifically for

Discovery and Reuse. 6 The Workflow: Before building a new integration, a developer searches Exchange to see if an Asset (API Specification, Fragment, Connector, or Template) already exists. This prevents duplication of effort—a core tenet of the API-led connectivity approach.

Why others are incorrect:

Runtime Manager: Used for deploying and monitoring running applications.

API Manager: Used for applying policies and governing APIs, not primarily for discovery by developers.

Object Store: A mechanism for storing data/state within a Mule application.
