

# SK0-005 Certification Practice - New SK0-005 Test Dumps

P.S. Free 2025 CompTIA SK0-005 dumps are available on Google Drive shared by TestKingIT: [https://drive.google.com/open?id=1HJ1Rr9nnQPCQ\\_dPHS75EkN-VQ800liGB](https://drive.google.com/open?id=1HJ1Rr9nnQPCQ_dPHS75EkN-VQ800liGB)

Preparing for the SK0-005 test can be challenging, especially when you are busy with other responsibilities. Candidates who don't use SK0-005 dumps fail in the SK0-005 examination and waste their resources. Using updated and valid SK0-005 questions; can help you develop skills essential to achieve success in the SK0-005 Certification Exam. That's why it's indispensable to use CompTIA Server+ Certification Exam (SK0-005) real exam dumps. TestKingIT understands the significance of Updated CompTIA SK0-005 Questions, and we're committed to helping candidates clear tests in one go.

There is a ton of CompTIA Server+ Certification Exam (SK0-005) prep material available on the internet. But the main thing to notice is their validity and reliability. Many applicants remain unsuccessful in locating the right CompTIA Server+ Certification Exam (SK0-005) practice test and lose their time and money.

## 2026 CompTIA Fantastic SK0-005: CompTIA Server+ Certification Exam Certification Practice

Even if you spend a small amount of time to prepare for SK0-005 certification, you can also pass the exam successfully with the help of TestKingIT CompTIA SK0-005 braindump. Because TestKingIT exam dumps contain all questions you can encounter in the actual exam, all you need to do is to memorize these questions and answers which can help you 100% pass the exam. This is the royal road to Pass SK0-005 Exam. Although you are busy working and you have not time to prepare for the exam, you want to get CompTIA SK0-005 certificate. At the moment, you must not miss TestKingIT SK0-005 certification training materials which are your unique choice.

### CompTIA Server+ Certification Exam Sample Questions (Q264-Q269):

#### NEW QUESTION # 264

Which of the following technologies would allow an administrator to build a software RAID on a Windows server?

- A. Dynamic disk
- B. Logical volume management
- C. GPT
- D. UEFI

**Answer: A**

Explanation:

Explanation

Dynamic disk is a technology that allows an administrator to build a software RAID on a Windows server.

Dynamic disk is a type of disk management that supports creating volumes that span multiple disks, stripe data across disks, mirror

data between disks, or use parity for fault tolerance. Dynamic disk can be used to create RAID 0 (striping), RAID 1 (mirroring), RAID 5 (striping with parity), or spanned volumes on Windows servers. Logical volume management is a technology that allows creating and resizing logical volumes on Linux servers. GPT (GUID Partition Table) is a standard for defining the partition structure on a disk. UEFI (Unified Extensible Firmware Interface) is a specification for the interface between the operating system and the firmware. <https://www.howtogeek.com/howto/40702/how-to-manage-and-use-lvm-logical-volume-management-in-ubuntu>  
<https://www.howtogeek.com/193669/whats-the-difference-between-gpt-and-mbr-when-partitioning-a-drive/>[https](https://www.howtogeek.com/193669/whats-the-difference-between-gpt-and-mbr-when-partitioning-a-drive/)

#### NEW QUESTION # 265

After a technician upgrades the firmware on a database server that is connected to two external storage arrays, the server prompts the technician to configure RAID. The technician knows the server had several configured RAID sets and thinks the firmware upgrade cleared the RAID configurations. Which of the following should the technician do to troubleshoot this issue?

- A. Restore the default RAID configuration and reboot.
- B. Boot the OS into recovery mode and rescan the disks.
- C. Power cycle the storage arrays and rescan RAID on the server.
- **D. Perform a rescan on the server's RAID controller.**

**Answer: D**

Explanation:

A rescan on the server's RAID controller is a possible troubleshooting step to detect the existing RAID configurations on the connected storage arrays. A firmware upgrade may cause the RAID controller to lose the RAID metadata or settings, and a rescan may restore them. A rescan is preferable to restoring the default RAID configuration, as the latter may erase the existing data on the arrays. Power cycling the storage arrays or booting the OS into recovery mode may not help if the RAID controller does not recognize the RAID sets.

#### NEW QUESTION # 266

A server administrator is implementing an authentication policy that will require users to use a token during login. Which of the following types of authentication is the administrator implementing?

- A. Something you are
- B. Something you do
- **C. Something you have**
- D. Something you know

**Answer: C**

Explanation:

Explanation

Something you have is one of the types of authentication methods that relies on a physical object or device that the user possesses to verify their identity. A token is an example of something you have, as it is a small device that generates a one-time password or code that the user enters during login. A token can be a hardware device, such as a key fob or a smart card, or a software application, such as an app on a smartphone or a browser extension. A token provides an additional layer of security to the authentication process, as it prevents unauthorized access even if the user's username and password are compromised<sup>1</sup>.

#### NEW QUESTION # 267

Following a recent power outage, a server in the data center has been constantly going offline and losing its configuration. Users have been experiencing access issues while using the application on the server. The server technician notices the date and time are incorrect when the server is online. All other servers are working. Which of the following would most likely cause this issue? (Select two).

- A. The server requires OS updates.
- B. The server has a malfunctioning LED panel.
- **C. The servers have NTP configured.**
- D. CPU frequency scaling is set too high.
- **E. The server has a CMOS battery failure.**

- F. The server has a faulty power supply.

**Answer: C,E**

Explanation:

A CMOS battery failure can cause the server to lose its BIOS settings, including the date and time, which can affect the server's functionality and connectivity. The servers have NTP (Network Time Protocol) configured to synchronize their clocks with a reliable time source, which can prevent time drift and ensure consistent timestamps. If one server has a wrong date and time, it can cause conflicts and errors with the other servers that have NTP configured.

Signs or symptoms of a CMOS battery failure2

NTP: Network Time Protocol

### NEW QUESTION # 268

The network's IDS is giving multiple alerts that unauthorized traffic from a critical application server is being sent to a known-bad public IP address.

One of the alerts contains the following information:

Exploit Alert

Attempted User Privilege Gain

2/2/07-3: 09:09 10.1.200.32

--> 208.206.12.9:80

This server application is part of a cluster in which two other servers are also servicing clients. The server administrator has verified the other servers are not sending out traffic to that public IP address. The IP address subnet of the application servers is 10.1.200.0/26. Which of the following should the administrator perform to ensure only authorized traffic is being sent from the application server and downtime is minimized? (Select two).

- A. Perform an antivirus scan on all servers within the cluster and reboot each server.
- B. Perform a vulnerability scan on all the servers within the cluster and patch accordingly.
- C. Change the IP address of all the servers in the cluster to the 208.206.12.0/26 subnet.
- D. Block access to 208.206.12.9 from all servers on the network.
- E. Enable GPO to install an antivirus on all the servers and perform a weekly reboot.
- F. Disable all services on the affected application server.

**Answer: A,B**

Explanation:

The administrator should perform an antivirus scan on all servers within the cluster and reboot each server, and block access to 208.206.12.9 from all servers on the network. These actions will help to remove any malware that may have infected the application server and prevent any further unauthorized traffic to the known-bad public IP address. An antivirus scan can detect and remove malicious software that may be sending data to an external source, and a reboot can clear any temporary files or processes that may be related to the malware. Blocking access to 208.206.12.9 from all servers on the network can prevent any future attempts to communicate with the malicious IP address.

### NEW QUESTION # 269

.....

Preparation from reliable material is essential to get success in the real CompTIA Server+ Certification Exam (SK0-005) exam. One of the most crucial aspects of test preparation is relying on CompTIA SK0-005 exam dumps. The authenticity of CompTIA Server+ Certification Exam (SK0-005) exam questions material plays a huge role in achieving a passing score. In the case of choosing, CompTIA Server+ Certification Exam (SK0-005) exam dumps outdated material, and one fails and loses resources. TestKingIT is committed to providing real SK0-005 Questions, ensuring that applicants get success in a short time.
