

CISSP Latest Test Simulator - ISC Certified Information Systems Security Professional (CISSP) - High-quality Exam CISSP Study Solutions

2026 Latest VCETorrent CISSP PDF Dumps and CISSP Exam Engine Free Share: <https://drive.google.com/open?id=1R0FiNvxFFHCtQ6Y73nZnB2ULnWvcZ42a>

Everyone has their own life planning. Different selects will have different acquisition. So the choice is important. VCETorrent's ISC CISSP Exam Training materials are the best things to help each IT worker to achieve the ambitious goal of his life. It includes questions and answers, and issimilar with the real exam questions. This really can be called the best training materials.

Having a general review of what you have learnt is quite necessary, since it will make you have a good command of the knowledge points. CISSP Online test engine is convenient and easy to learn, and it has the testing history and performance review. It supports all web browsers, and you can also have offline practice. Before buying CISSP Exam Dumps, you can try free demo first, so that you can have a deeper understanding of the exam. We have online and offline chat service for CISSP training materials. If you have any questions, you can contact us, and we will give you reply as quickly as we can.

Latest Updated CISSP Latest Test Simulator & Leader in Qualification Exams & Free PDF ISC Certified Information Systems Security Professional (CISSP)

The web-based ISC CISSP Practice Exam is compatible with all operating systems, including Mac, Linux, iOS, Android, and Windows. It is a browser-based Certified Information Systems Security Professional (CISSP) (CISSP) practice exam that works on all major browsers, including Chrome, Firefox, Safari, Internet Explorer, and Opera. This means that you won't have to worry about installing any complicated software or plug-ins.

ISC Certified Information Systems Security Professional (CISSP) Sample Questions (Q879-Q884):

NEW QUESTION # 879

Which of the following is of GREATEST assistance to auditors when reviewing system configurations?

- A. Operating System (OS) baselines
- B. System backup documentation
- C. User administration procedures
- D. Change management processes

Answer: D

NEW QUESTION # 880

Which of the following is the BEST definition of Cross-Site Request Forgery (CSRF)?

- A. An attack that makes an illegal request across security zones and thereby forges itself into the security database of the system
- B. An attack that injects a script into a web page to execute a privileged command

- C. An attack which forces an end user to execute unwanted actions on a web application in which they are currently authenticated
- D. An attack that forges a false Structure Query Language (SQL) command across systems

Answer: C

NEW QUESTION # 881

What is the role of IKE within the IPsec protocol?

- A. enforcing quality of service
- B. peer authentication and key exchange
- C. data encryption
- D. data signature

Answer: B

Explanation:

Explanation/Reference:

Explanation:

The main protocols that make up the IPsec suite and their basic functionality are as follows:

Authentication Header (AH) provides data integrity, data origin authentication, and protection from replay attacks.

Encapsulating Security Payload (ESP) provides confidentiality, data-origin authentication, and data integrity.

Internet Security Association and Key Management Protocol (ISAKMP) provides a framework for security association creation and key exchange.

Internet Key Exchange (IKE) provides authenticated keying material for use with ISAKMP

Incorrect Answers:

B: The IPsec protocol uses Encapsulating Security Payload (ESP) for encryption, not IKE.

C: The IPsec protocol uses data signatures to provide data integrity. IKE is not used for signing the data packets.

D: The IPsec protocol does not enforce quality of service.

NEW QUESTION # 882

Which of the following is the most critical item from a disaster recovery point of view?

- A. Hardware/Software
- B. Data
- C. Software Applications
- D. Communication Links

Answer: B

Explanation:

Explanation/Reference:

Explanation:

Data loss has the most negative impact on business functions. Data loss often lead to business failure.

Incorrect Answers:

B: Software can be reinstalled and hardware can be replaced, and are therefore less critical compared to loss of data.

C: Communication links can quite easily be put back again, compared to loss of data.

D: Loss of applications is Critical as they can be reinstalled.

NEW QUESTION # 883

Which of the following should NOT be performed by an operator?

- A. Controlling job flow
- **B. Data entry**
- C. Monitoring execution of the system
- D. Implementing the initial program load

Answer: B

Explanation:

Under the principle of separation of duties, an operator should not be performing data entry. This should be left to data entry personnel.

System operators represent a class of users typically found in data center environments where mainframe systems are used. They provide day-to-day operations of the mainframe environment, ensuring that scheduled jobs are running effectively and troubleshooting problems that may arise. They also act as the arms and legs of the mainframe environment, load and unloading tape and results of job print runs. Operators have elevated privileges, but less than those of system administrators. If misused, these privileges may be used to circumvent the system's security policy. As such, use of these privileges should be monitored through audit logs.

Some of the privileges and responsibilities assigned to operators include:

Implementing the initial program load: This is used to start the operating system. The boot process or initial program load of a system is a critical time for ensuring system security. Interruptions to this process may reduce the integrity of the system or cause the system to crash, precluding its availability.

Monitoring execution of the system: Operators respond to various events, to include errors, interruptions, and job completion messages.

Volume mounting: This allows the desired application access to the system and its data.

Controlling job flow: Operators can initiate, pause, or terminate programs. This may allow an operator to affect the scheduling of jobs. Controlling job flow involves the manipulation of configuration information needed by the system. Operators with the ability to control a job or application can cause output to be altered or diverted, which can threaten the confidentiality.

Bypass label processing: This allows the operator to bypass security label information to run foreign tapes (foreign tapes are those from a different data center that would not be using the same label format that the system could run). This privilege should be strictly controlled to prevent unauthorized access.

Renaming and relabeling resources: This is sometimes necessary in the mainframe environment to allow programs to properly execute. Use of this privilege should be monitored, as it can allow the unauthorized viewing of sensitive information.

Reassignment of ports and lines: Operators are allowed to reassign ports or lines. If misused, reassignment can cause program errors, such as sending sensitive output to an unsecured location. Furthermore, an incidental port may be opened, subjecting the system to an attack through the creation of a new entry point into the system.
