Before the clients purchase our GH-200 study practice guide, they can have a free trial freely. The clients can log in our company's website and visit the pages of our products. The pages of our products lists many important information about our GH-200 exam materials and they include the price, version and updated time of our products, the exam name and code, the total amount of the questions and answers, the merits of our GH-200 useful test guide and the discounts. You can have a comprehensive understanding of our GH-200 useful test guide after you see this information.

Microsoft GH-200 Exam Overview:

Certification Vendor:	Microsoft / GitHub
Exam Name:	GitHub Actions Exam
Exam Number:	GH-200
Available Languages:	English
Exam Format:	Scenario-based questions, Multiple choice, Multiple response
Exam Duration:	120 minutes
Related Certifications:	GitHub Copilot GitHub Foundations GitHub Advanced Security
Recommended Training:	GitHub Skills - Actions courses Microsoft Learn: GitHub Actions learning paths
Exam Registration:	GH-200 Study Guide Microsoft Learn Certification Page
Sample Questions:	Microsoft GH-200 Sample Questions
Exam Way:	Online proctored (Pearson VUE / Microsoft Learn credentialing system)

Pre Condition:	Recommended: intermediate experience with GitHub, CI/CD, and GitHub Actions workflows; familiarity with YAML and DevOps concepts
Official Syllabus URL:	https://learn.microsoft.com/en-us/credentials/certifications/resources/study-guides/gh-200

GH-200 Valid Braindumps Questions & Key GH-200 Concepts

We are carrying out renovation about GH-200 test engine all the time to meet the different requirements of the diversified production market. Thus we have prepared three kinds of versions on GH-200 preparation materials. If you are used to study with paper-based materials you can choose the PDF version of our GH-200 Study Guide. If you would like to get the mock test before the real GH-200 exam you can choose the software version, and if you want to study in anywhere at any time then our online APP version is your best choice since you can download it in any electronic devices.

Microsoft GH-200 Exam Syllabus Topics:

Topic	Details
Topic 1	Consume Workflows: This domain targets Software Developers and Quality Assurance Engineers and focuses on interpreting workflow runs and their outcomes. It covers identifying triggering events, reading workflow configurations, troubleshooting failures by analyzing logs, enabling debug logging, managing environment variables, caching dependencies, and passing data between jobs. Candidates also manage workflow runs, artifacts, approvals, and status badges, as well as locating workflows within repositories and leveraging organizational templated workflows.
Topic 2	Manage GitHub Actions in the Enterprise: This section measures the expertise of Enterprise Administrators and Platform Engineers in distributing and managing GitHub Actions and workflows at the organizational level. It includes reuse and sharing of templates, strategies for managing reusable components via repositories and naming conventions, controlling access to actions, setting organization-wide usage policies, and planning maintenance to ensure efficient enterprise-wide deployment of GitHub Actions.
Topic 3	Author and Maintain Workflows: This section of the exam measures skills of DevOps Engineers and Automation Specialists and covers building and managing workflows triggered by events such as pushes, scheduled times, manual triggers, and webhooks. It includes understanding workflow components like jobs, steps, actions, and runners, syntax correctness, environment variables, secrets management, and dependencies between jobs. Candidates will also demonstrate practical abilities to create workflows for various purposes, including publishing packages, using service containers, routing jobs, and deploying releases to cloud providers.
Topic 4	Author and Maintain Actions: This domain evaluates the abilities of Action Developers and Automation Engineers to select and create suitable types of GitHub Actions, such as JavaScript, Docker containers, or run steps. It emphasizes troubleshooting action code, understanding the components and file structures of actions, and using workflow commands within actions to communicate with runners, including exit code management.

Microsoft GitHub Actions Sample Questions (Q87-Q92):

NEW QUESTION # 87

As a developer, you want to run a workflow from the Actions tab in GitHub. Which YAML snippet should you use to match the interface in this image?

Use workflow from

Branch: main ▼

Test suite

functional

Run workflow

Microsoft

on:

workflow_run:

inputs:

test_suite:

description: Test suite

type: choice

options:

- functional

- regression

• A.

on:

workflow_dispatch:

inputs:

test_suite:

description: Test suite

type: choice

value: functional

options:

- regression

• B.

```

on:
  workflow_dispatch:
    inputs:
      test_suite:
        description: Test suite
        type: choice
        options:
          - functional
          - regression

```

- C.

```

on:
  workflow_run:
    inputs:
      test_suite:
        description: Test suite
        type: string
        options:
          - functional
          - regression

```

- D.

Answer: C

Explanation:

Use workflow_dispatch as it used for manual trigger source (UI button, CLI, or API).

Use B as it has the option functional.

Incorrect:

[Not D]

D has only the single option regression, it does not have the option functional which is displayed in the graphic.

[Not A, Not C]

Must use workflow_dispatch not workflow_run.

Note:

In GitHub Actions, the primary difference is how the workflow is triggered: workflow_dispatch is for manual execution by a person, while workflow_run is for automatic execution triggered by another workflow's activity.

NEW QUESTION # 88

Which of the following statements are true regarding the use of GitHub Actions on a GitHub Enterprise Server instance? (Choose three.)

- A. Third party actions can be manually synchronized for use on GitHub Enterprise Server
- B. Most GitHub authored actions are automatically bundled for use on GitHub Enterprise Server
- C. Actions created by GitHub are automatically available and cannot be disabled
- D. Actions must be defined in the .github repository
- E. Third party actions can be used on GitHub Enterprise Server by configuring GitHub Connect

- F. Use of GitHub Actions on GitHub Enterprise Server requires a persistent internet connection

Answer: A,E,F

NEW QUESTION # 89

As a developer, what two options should you recommend to implement standards for automation reuse? Each correct answer presents a complete solution. NOTE: Each correct answer is worth one point.

- A. Create a marketplace partition to publish reusable automation for the company.
- B. Create workflow templates and store them in the organization's .github repository.
- C. Create reusable actions and workflows that can be called from other workflows.
- D. Store shared corporate actions in subfolders in a defined and documented internally accessible repository.

Answer: C,D

Explanation:

[A]

Implementing standards for reusable actions and workflows is the most effective way to reduce duplication and maintain consistency across your GitHub organization.

Reusable Workflows (workflow_call)

Best for standardizing entire processes (e.g., a complete CI/CD pipeline).

Location: Defined in .github/workflows/ of a central repository.

Trigger: Use the on: workflow_call trigger to define inputs, secrets, and outputs.

Usage: Called from another workflow using the uses keyword (e.g., owner/repo/.github/workflows/ci.yml@v1).

Benefit: They allow you to enforce security scans, build steps, and deployment gates across multiple repositories from a single source

[C]

Implementing a marketplace partition for internal GitHub Actions is a key strategy for scaling automation securely and efficiently across a company. This centralized approach ensures that developers use vetted, high-quality automation while adhering to corporate standards.

Strategic Implementation of Internal Reuse

To implement standards for automation reuse effectively, focus on these core components:

[C] Internal Actions Marketplace: Create a dedicated organization or specific repositories to host and display shared actions. This "marketplace" acts as a curated directory of approved automations, preventing the use of unverified third-party actions from the public marketplace.

Workflow Templates: Store standardized workflow templates in your organization's .github repository. These templates appear in the "Actions" tab when a user creates a new workflow, ensuring consistency across different teams.

[A] Reusable Workflows: Design modular workflows that can be called by other repositories using the uses keyword. Unlike standard actions, these can manage entire jobs and runners, making them ideal for standardizing complex CI/CD pipelines.

Internal Repository Sharing: Set repository visibility to Internal and configure Actions permissions to allow access from other repositories in the organization or enterprise.

<https://xebia.com/blog/setting-up-an-internal-github-actions-marketplace>

NEW QUESTION # 90

You need to create new workflows to deploy to an unfamiliar cloud provider. What is the fastest and safest way to begin?

- A. Download the CLI for the cloud provider and review the associated documentation.
- B. Use the actions/jenkins-plugin action to utilize an existing Jenkins plugin for the cloud provider.
- C. Search GitHub Marketplace for verified actions published by the cloud provider.
- D. Search GitHub Marketplace for actions created by GitHub.
- E. Create a custom action to wrap the cloud provider's CLI.

Answer: C

Explanation:

Searching the GitHub Marketplace for verified actions published by the cloud provider is the quickest and safest approach. Many cloud providers offer verified GitHub Actions that are maintained and optimized to interact with their services. These actions typically

come with the correct configurations and best practices, allowing you to get started quickly without reinventing the wheel.

Note: About GitHub Marketplace for apps

GitHub Marketplace where you can share your apps with everyone.

GitHub Marketplace connects you to developers who want to extend and improve their GitHub workflows. You can list free and paid tools for developers to use in GitHub Marketplace. GitHub Marketplace offers developers two types of tools: GitHub Actions and Apps, and each tool requires different steps for adding it to GitHub Marketplace.

GitHub Actions

Anyone can publish an action in GitHub Marketplace. GitHub verifies some partner organizations and these are shown as verified creators.

<https://docs.github.com/en/enterprise-cloud@latest/apps/github-marketplace/github-marketplace-overview/about-github-marketplace-for-apps>

NEW QUESTION # 91

What are the two ways to pass data between jobs? (Choose two.)

- A. Use data storage.
- **B. Use artifact storage.**
- C. Use the copy action to save the data that should be passed in the artifacts folder.
- **D. Use job outputs**
- E. Use the copy action with cache parameter to cache the data
- F. Use the copy action with restore parameter to restore the data from the cache

Answer: B,D

Explanation:

Job outputs are used to pass data from one job to another in a workflow. A job can produce output values (like variables or files), which can be referenced by subsequent jobs using the needs keyword and `${{ steps.step_id.outputs.output_name }}` syntax.

Artifact storage allows data (such as files or results) to be saved by a job and then retrieved by another job in a later step. This is commonly used for passing large amounts of data or files between jobs.
