A Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) (NCP-MCA) practice questions is a helpful, proven strategy to crack the Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) (NCP-MCA) exam successfully. It helps candidates to know their weaknesses and overall performance. TestsDumps software has hundreds of Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) (NCP-MCA) exam dumps that are useful to practice in real-time.

Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q54-Q59):

NEW QUESTION # 54

An administrator has built a Playbook to run a Powershell script in a VM when a specific alert is generated. Several days later, the alert is generated, but the script does not execute and there are no Plays recorded for the Playbook. What is causing this issue?

- A. The script executed, but closed with an error code.
- **B. The Playbook was never enabled.**
- C. The path to the script was not correct.
- D. The version of Playbooks is not correct for the version of Prism Central.

Answer: B

Explanation:

A Playbook is a set of actions that are triggered by an event or a schedule. To run a Playbook, it must be enabled first. If a Playbook is not enabled, it will not respond to any events or schedules, and no Plays will be recorded for it. Therefore, the most likely cause of the issue is that the administrator forgot to enable the Playbook after building it. References: Nutanix Certified Professional - Multicloud Automation (NCP-MCA) Exam Blueprint Guide, page 13, section 3.2. Nutanix Multicloud Automation Administration (NMCAA) course, module 4, lesson 2.

NEW QUESTION # 55

During the deployment of a multi-step Blueprint, a failure is encountered. The administrator corrected the failed step and saved the Blueprint.

What should the administrator do next?

- A. Delete the failed application and Launch a new application.
- **B. Use Continue in the failed application to retry.**
- C. Upon clicking Save the Blueprint task will be retried automatically.
- D. Soft Delete the failed application and Launch a new application.

Answer: B

Explanation:

If a Blueprint deployment fails, the administrator can use the Continue option in the Self-Service Portal to resume the deployment from the point of failure. This option will retry the failed task and continue with the remaining tasks in the Blueprint. The administrator does not need to delete the application or launch a new one, as this would waste time and resources. Saving the Blueprint will not automatically retry the task, as the Blueprint is only a template for the deployment.

NEW QUESTION # 56

A company has the following departments:

HR

Accounting

Support

Sales

e-commerce

An administrator has created a Playbook that will add memory to the affected VMS when the configured alert is triggered.

Which VMS will get more memory?

- A. All the VMS from Sales
- B. Production VMS from the eCommerce department
- **C. Production VMS from Support and eCommerce**
- D. All the VMS categorized as Production.

Answer: C

NEW QUESTION # 57

Which RBAC role enables adding VMs to a project?

- A. Operation
- B. Developer
- C. Prism Admin
- **D. Project Admin**

Answer: D

Explanation:

In Nutanix Calm, the RBAC (Role-Based Access Control) role that enables adding VMs to a project is the Project Admin role. Project Admins have the necessary permissions to manage and configure resources within a project, including the addition of VMs, handling project settings, and managing application blueprints.

NEW QUESTION # 58

An administrator needs to reduce the number of vCPUs in a VM on the following Sunday at 1:00AM.

How can the administrator automate this task?

- A. Create a script to call a REST API and configure a cron job.
- B. Create a playbook triggered with an alert.
- C. Create a runbook triggered with an alert.
- **D. Create a playbook triggered at a specified time.**

Answer: D

Explanation:

To automate the reduction of vCPUs in a VM on a specific schedule, the administrator should create a playbook triggered at a specified time. This playbook can be scheduled to run at 1:00 AM on the following Sunday and perform the task of reducing the number of vCPUs in the VM.
