1. What are the key differences between Infrastructure as a Service (IaaS) and Platform as a Service (PaaS) in cloud computing?

Answer:

IaaS provides virtualized computing resources over the internet, allowing users to manage operating systems, storage, and applications themselves. PaaS, on the other hand, offers a platform with tools and services to develop, test, and deploy applications without managing the underlying infrastructure directly.

2. How does the pay-as-you-go model in cloud computing benefit organizations financially?

Answer:

The pay-as-you-go model allows businesses to pay only for the resources they actually use, which helps reduce capital expenditure. This model supports better budget management, reduces wasteful spending, and offers flexibility in scaling resources based on real-time demand.

3. What is the shared responsibility model in cloud security and why is it important?

Answer:

The shared responsibility model outlines the division of security tasks between the cloud provider and the customer. While the provider secures the infrastructure, the customer secures their data and applications. This model ensures clarity in security roles and reduces vulnerabilities.

WGU Cloud Deployment and Operations Sample Questions (Q17-Q22):

NEW QUESTION # 17

(An administrator successfully accesses an EC2 instance via SSH from a local computer then stops it and starts it. Following the restart, the EC2 instance is no longer accessible. Which solution should be used to resolve the issue?)

- A. Add a rule to the security group associated with the NIC of the EC2 instance
- B. Add a route to the route table associated with the EC2 instance subnet
- C. Change the IP address used to connect to the EC2 instance
- D. Change the port used to connect to EC2 instance

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

After stopping and starting an EC2 instance, the public IP address may change (unless an Elastic IP is attached), but the security group rules remain intact. If the instance is no longer accessible via SSH, it's likely due to an inbound rule (e.g., for port 22) not being correctly configured or applied. Adding or verifying a rule in the security group associated with the network interface (NIC) to allow SSH (port 22) from the administrator's IP resolves this. The WGU Cloud Deployment and Operations Study Guide (Section 3.2, Security Groups) states, "Stopping and starting an EC2 instance may require verifying or adding an inbound SSH rule (port 22) in the security group if connectivity is lost due to IP or rule misconfiguration." Route table or IP changes are not the primary issue here.

NEW QUESTION # 18

(An organization uses CloudFormation to deploy AWS infrastructure. The templates are built in JSON and deploy EC2 instances across multiple regions. Which solution should be used to set values in the template based on region-specific AMI IDs?)

- A. Outputs
- B. WaitCondition
- C. Resources
- D. Mappings

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The Mappings section in a CloudFormation template should be used to set values based on region-specific AMI IDs. Mappings allow the template to define a lookup table that associates regions with corresponding AMI IDs, enabling dynamic selection during stack creation across multiple regions. The WGU Cloud Deployment and Operations Study Guide (Section 5.3, CloudFormation Mappings) states, "The Mappings section enables region-specific configurations, such as mapping AMI IDs to regions (e.g., 'us-east-1': 'ami-123456'), ensuring the correct AMI is used based on the deployment region." Outputs, WaitCondition, and Resources do not provide this mapping functionality.

NEW QUESTION # 19

(An administrator sets up a route table with the default outbound route via an internet gateway and links it to a VPC. Which solution should be used to ensure the route takes effect?)

- A. Configure propagation
- B. Configure tags
- C. Create a subnet association

- D. Create an edge association

Answer: C

Explanation:

To ensure the route table with a default outbound route via an internet gateway takes effect, the administrator must create a subnet association, linking the route table to specific subnets within the VPC. This association applies the routing rules to the subnet's traffic. The WGU Cloud Deployment and Operations Study Guide (Section 3.2, VPC Routing) states, "A route table must be associated with a subnet (subnet association) to enforce routing rules, such as the default route to an internet gateway, ensuring outbound traffic follows the defined path." Propagation, tags, and edge associations do not activate the route.

NEW QUESTION # 20

(An administrator needs to deploy a NAT gateway in an existing VPC subnet. Which two tasks should this administrator perform during deployment? Choose 2 answers.)

- A. Assign an elastic IP address to the NAT gateway
- B. Configure the access control list associated with the subnet
- C. Configure the route table associated with the subnet
- D. Assign a private IP address to the NAT gateway

Answer: A,C

Explanation:

To deploy a NAT gateway in an existing VPC subnet, the administrator must assign an elastic IP address to the NAT gateway for public internet access and configure the route table associated with the subnet to route traffic through the NAT gateway. The WGU Cloud Deployment and Operations Study Guide (Section 3.2, NAT Gateway) states, "Deployment of a NAT gateway requires an elastic IP address for outbound internet connectivity and a route table update to direct private subnet traffic to the NAT gateway (e.g., 0.0.0.0/0 via NAT)." Private IP assignment and ACL configuration are not required steps.

NEW QUESTION # 21

(What is the role of AWS Trusted Advisor?)

- A. It provides recommendations on patches to be performed on resources.
- B. It provides a holistic overview of the health of architecture.
- C. It provides recommendations to help follow AWS best practices.
- D. It provides an assessment on unused IAM roles.

Answer: C

Explanation:

AWS Trusted Advisor provides recommendations to help follow AWS best practices, analyzing the environment for cost optimization, security, performance, and fault tolerance. It offers actionable insights to improve resource usage. The WGU Cloud Deployment and Operations Study Guide (Section 6.4, Trusted Advisor) states, "Trusted Advisor evaluates your AWS environment against best practices, providing recommendations in categories like cost optimization and security (e.g., enabling MFA or removing unused resources)." Options A, B, and D overstate or misrepresent its role, as it does not focus solely on unused IAM roles, holistic health overviews, or patch recommendations.
