XK0-005 Valid Test Blueprint | XK0-005 Latest Exam Pdf

Itcerttest XK0-005 exam dumps have been designed with the best possible format, ensuring all necessary information packed in them. Our experts have used only the authentic and recommended sources of studies by the certifications vendors for exam preparation. The information in the XK0-005 Brain Dumps has been made simple up to the level of even an average exam candidate. To ease you in your preparation, each XK0-005 dumps are made into easy English so that you learn information without any difficulty to understand them.

CompTIA XK0-005 exam is a certification exam that covers the fundamental concepts and skills required to work with the Linux operating system. CompTIA Linux+ Certification Exam certification is ideal for IT professionals looking to expand their knowledge and skills in Linux administration, configuration, and troubleshooting. XK0-005 Exam is designed to test candidates on their ability to install, configure, manage, and troubleshoot Linux systems, as well as their understanding of Linux security, networking, and scripting.

CompTIA Linux+ Certification Exam Sample Questions (Q474-Q479):

NEW QUESTION # 474

A systems administrator observes high latency values when reaching a remote web server. Which of the following commands will help determine and isolate issues on the network side?

- A. netstat
- **B. ntr**
- C. route
- D. dig

Answer: B

Explanation:

<https://www.keycdn.com/support/what-is-latency>

NEW QUESTION # 475

A systems engineer deploys a new application server, but the server cannot communicate with the back-end database hostname. The engineer confirms that the application server can ping the database server's IP address. Which of the following is the most likely cause of the issue?

- **A. Incorrect DNS servers**
- B. Missing route configuration
- C. Misconfigured subnet mask
- D. Unreachable default gateway

Answer: A

Explanation:

If the application server can ping the database server by its IP address but not by its hostname, it indicates a DNS resolution issue. The most likely cause is incorrect DNS server configuration. The engineer should verify the DNS settings in `/etc/resolv.conf` or the network configuration.

NEW QUESTION # 476

A junior systems administrator is diagnosing an issue with latency. The administrator issues the command at a terminal and receives the following output: `mtr www.comptia.org`

Given this scenario and the output, which of the following should be reported to the network team for investigation? (Choose two.)

- **A. Host 2 is experiencing high packet loss, indicating the link is overloaded.**
- B. Host 3 is set to filter ICMP reply packets.
- C. Host 2 is experiencing low bandwidth, indicating the ISP is blocking traffic.
- D. Host 1 is set to filter ICMP reply packets.
- E. Host 1 is set to filter ICMP echo packets.
- **F. Host 3 is set to filter ICMP echo packets.**

Answer: A,F

NEW QUESTION # 477

A systems administrator configured firewall rules using `firewalld`. However, after the system is rebooted, the firewall rules are not present:

The systems administrator makes additional checks:

Which of the following is the reason the firewall rules are not active?

- A. The wrong system target is activated.
- B. `iptables` is conflicting with `firewalld`.
- **C. The `firewalld` service is not enabled.**
- D. `FIREWALL_ARGS` has no value assigned.

Answer: C

Explanation:

The reason the firewall rules are not active is that the firewalld service is not enabled. This means that the service will not start automatically at boot time or after a system reload. To enable the firewalld service, the systems administrator needs to use the command `sudo systemctl enable firewalld`. This will create a symbolic link from the firewalld service file to the appropriate systemd target, such as `multi-user.target`. Enabling the service does not start it immediately, so the systems administrator also needs to use the command `sudo systemctl start firewalld` or `sudo systemctl reload firewalld` to activate the firewall rules.

The other options are not correct reasons for the firewall rules not being active. `iptables` is not conflicting with `firewalld`, because `firewalld` uses `iptables` as its backend by default. The wrong system target is not activated, because `firewalld` is independent of the system target and can be enabled for any target. `FIREWALL_ARGS` has no value assigned, but this is not a problem, because `FIREWALL_ARGS` is an optional environment variable that can be used to pass additional arguments to the `firewalld` daemon, such as `--debug` or `--nofork`. If `FIREWALL_ARGS` is empty or not defined, `firewalld` will use its default arguments. References: `firewalld`.

`service(8)` - Linux manual page; `firewall-cmd(1)` - Linux manual page; `systemctl(1)` - Linux manual page

NEW QUESTION # 478

An administrator wants to add a user named `comptia` to the system administrators group. Which of the following commands will accomplish this task?

- A. `Useradd -sG wheel comptia`
- B. `visudo -sG wheel comptia`
- C. `Usermod *sG wheel comptia`
- D. `sudo -sG wheel comptia`

Answer: A

NEW QUESTION # 479

.....

You can learn from your CompTIA Linux+ Certification Exam (XK0-005) practice test mistakes and overcome them before the actual CompTIA Linux+ Certification Exam (XK0-005) exam. The software keeps track of the previous CompTIA Linux+ Certification Exam (XK0-005) practice exam attempts and shows the changes of each attempt. You don't need to wait days or weeks to get your performance report. The software displays the result of the CompTIA XK0-005 Practice Test immediately, which is an excellent way to understand which area needs more attention.
