- A. SAP Build
- B. SAP Business Application Studio
- C. SAP Cloud SDK
- D. SAP Fiori extensibility apps

Answer: A,B

NEW QUESTION # 21

You are using the Test Automation Tool. When do you define a data variant?

- A. After creating a test plan.
- B. After providing consent for Post-Upgrade Testing.
- C. After binding a process step field to a Test Data Container.
- D. After customizing a test process.

Answer: D

Explanation:

A data variant is a set of data values that can be used to execute a test process in the Test Automation Tool.

You can define multiple data variants for a test process to test different scenarios with different input data. You can also use data variants to parameterize your test process and reuse it for different test cases¹.

You define a data variant after binding a process step field to a Test Data Container. A Test Data Container is a reusable object that stores test data for a specific field or parameter. You can create and manage Test Data Containers in the Manage Test Data app.

You can bind a process step field to a Test Data Container by selecting the field in the Test Automation Tool and choosing the Test Data Container from the list. This will create a link between the field and the Test Data Container, allowing you to use the data stored in the Test Data Container for the field².

After binding a process step field to a Test Data Container, you can define a data variant by selecting the Test Data Container and choosing the Data Variant option. This will open a dialog where you can enter the data values for the data variant. You can also specify a name and a description for the data variant. You can create as many data variants as you need for a Test Data Container². Therefore, the correct answer is B, as you define a data variant after binding a process step field to a Test Data Container.

References = 1 Test Automation Tool - SAP Help Portal 2 Test Data Containers - SAP Help Portal In the context of using the Test Automation Tool within SAP S/4HANA Cloud Public Edition, defining a data variant is a crucial step. This step occurs:

* After binding a process step field to a Test Data Container: A Test Data Container (TDC) is used to store data that can be reused across multiple test cases. When a field in a process step is bound to a TDC, it means that the test case will use the data specified within the TDC. After this binding, a data variant can be defined to specify different sets of data or conditions under which the test case should be executed. This allows for more flexible and comprehensive testing scenarios, ensuring that the application behaves as expected under various conditions.

NEW QUESTION # 22

.....

Are you preparing for the C-S4CPB-2508 test recently? You may have a strong desire to get the C-S4CPB-2508 exam certification. Now, you may be pleasure, VCE4Dumps C-S4CPB-2508 can relieve your exam stress.
