Salesforce Certified Slack Developer Sample Questions (Q50-Q55):

NEW QUESTION # 50

What distinguishes a single workspace app from a distributed app in Slack?

- A. Single workspace apps are automatically included in the Slack App Directory, while distributed apps need to go through an approval process
- B. A single workspace app can be customized by any user within the workspace, while a distributed app's settings are controlled by workspace admins only
- C. A single workspace app is designed to function within one specific workspace, whereas a distributed app can be installed across multiple workspaces
- D. Distributed apps can access more advanced Slack API features compared to single workspace

Answer: C

Explanation:

A single workspace app is designed to function within one specific workspace, whereas a distributed app can be installed across multiple workspaces. The primary distinction between a single workspace app and a distributed app lies in their scope of installation and use. A single workspace app is created for and used within one specific workspace, addressing its unique needs. In contrast, a distributed app is built to be installable and functional across multiple different workspaces, making it suitable for broader use cases.

Why not the other options:

*The ability to customize app settings does not differentiate between these two types of apps.

*Access to Slack API features is not generally restricted by the type of app in terms of single workspace versus distributed.

*Inclusion in the Slack App Directory is not automatically granted for single workspace apps.

NEW QUESTION # 51

Your team is developing a Slack app that requires fetching detailed user information, including custom fields, for a report.

Which Slack API is best suited for this task?

- A. Events API
- **B. Web API using the users.list method**
- C. RTM (Real-Time Messaging) API
- D. Slash Commands

Answer: B

Explanation:

Web API using the users.list method The Web API with the users.list method is the most suitable for fetching detailed user information, including custom fields. This method provides comprehensive data about users in the Slack workspace.

Why not the other options:

*The RTM API is designed for real-time messaging, not for fetching detailed user information.

*The Events API is used to respond to specific events within Slack, not for extracting user data.

*Slash Commands are for executing commands within Slack and do not provide user information or reports.

NEW QUESTION # 52

You are developing a Slack app for a human resources team to gather and process employee feedback.

Which Slack surface would be most appropriate for collecting detailed feedback from employees?

- A. Send a message to a dedicated channel asking for feedback
- B. Utilize direct messages to individually ask for feedback
- **C. Use modals to collect feedback through a structured form**
- D. Create an interactive message with buttons for feedback options

Answer: C

Explanation:

Use modals to collect feedback through a structured form Modals provide a focused space for users to input detailed information in a structured manner. For collecting employee feedback, modals offer a private and organized way to gather data, allowing for various input types and validation.

Why not the other options:

*A channel message might not provide the privacy or structure needed for detailed feedback.

*Direct messages can be less structured and might not be suitable for collecting standardized feedback.

*While interactive messages are engaging, they might not be suitable for detailed or free-form feedback.

NEW QUESTION # 53

Your Slack app is designed to provide custom notifications to users based on their activity within various channels.

Which OAuth scope should you request to adhere to security best practices?

- **A. channels:history**
- B. chat:write
- C. users:read
- D. admin

Answer: A

Explanation:

channels:history The channels:history scope is necessary for an app that needs to access channel activity to provide custom notifications. This scope allows the app to read messages and other channel activity, aligning with its functionality while adhering to

security best practices of requesting only necessary permissions.

Why not the other options:

*Chat:write is used for sending messages, not for accessing channel activity.

*Users:read is for accessing basic information about users, which does not include channel activity.

*The admin scope provides extensive administrative control over the workspace, which is excessive and unnecessary for the app's stated functionality.

NEW QUESTION # 54

Your Slack app is designed to create and manage private channels.

Which OAuth scope should you request to ensure security and appropriate functionality?

- A. groups:write
- B. channels:read
- C. im:write
- D. users:read

Answer: A

Explanation:

groups:write The groups:write scope is necessary for an app that needs to create and manage private channels (known as groups in Slack API terminology). This scope allows the app to perform the required actions within private channels while ensuring it has only the permissions it needs.

Why not the other options:

*Channels:read allows reading public channel data, not managing private channels.

*Im:write is meant for managing direct message conversations, not private channels.

*Users:read is for accessing user information and is unrelated to channel management.
