Splunk SPLK-1002 Splunk Core Certified Power User Exam 1

**Certification SPLK-1002 Training, SPLK-1002 Test King**

What's more, part of that TrainingDump SPLK-1002 dumps now are free: [https://drive.google.com/open?id=14ju6\\_aD4GBzdbHB67ZuSgy421Wckmp4](https://drive.google.com/open?id=14ju6_aD4GBzdbHB67ZuSgy421Wckmp4)

On the one hand, according to the statistics from the feedback of all of our customers, the pass rate among our customers who prepared for the exam with the help of our SPLK-1002 guide torrent has reached as high as 98% to 100%. On the other hand, the simulation test is available in our software version, which is useful for you to get accustomed to the SPLK-1002 Exam atmosphere. Please believe us that our SPLK-1002 torrent question is the best choice for you.

### Exam Details

SPLK-1002 has 65 multiple-select and multiple-choice questions that should be answered in 57 minutes, with an addition of 3 minutes that are given one to get familiar with the exam agreement. Taking this test will cost \$ The applicants will be rated on a variety of knowledge areas, such as the following:

- Filtering as well as formatting of results
- Knowledge objects
- Workflow actions
- Tags as well as event types
- CIM
- Transformation of commands as well as visualizations
- Macros

Candidates are advised to take the training courses provided by the vendor when preparing for SPLK-1002 exam. To succeed on the first attempt, they should tackle all the lectures, hands-on sessions, and practice questions to ensure they are adequately ready.

## 인기자격증 SPLK-1002 높은 통과율 공부자료 인증시험덤프

IT 업계에 종사하고 계시나요? 최근 유행하는 Splunk 인증 SPLK-1002 IT 인증 시험에 도전해볼 생각은 없으신지요? IT 인증 자격증 취득 의향이 있으시면 저희 Pass4Test의 Splunk 인증 SPLK-1002 덤프로 시험을 준비하시면 100% 시험 통과 가능합니다. Pass4Test의 Splunk 인증 SPLK-1002 덤프는 착한 가격에 고품질을 지닌 최고, 최신의 버전입니다. Pass4Test 덤프로 가볼까요?

## 최신 Splunk Core Certified Power User SPLK-1002 무료 샘플문제 (Q184-Q189):

### 질문 # 184

Which of the following statements describes the use of the Field Extractor (FX)?

- A. The Field Extractor uses PERL to extract fields from the raw events.
- B. Fields extracted using the Field Extractor persist as knowledge objects.
- C. The Field Extractor automatically extracts all fields at search time.
- **D. Fields extracted using the Field Extractor do not persist and must be defined for each search.**

정답: D

### 질문 # 185

Which of these search strings is NOT valid:

- A. `index=web status=5-* | chart count by host, status`
- B. `index=web status=50* | chart count over host, status`
- **C. `index=web status=50* | chart count over host by status`**

정답: C

### 질문 # 186

A field alias is created where field1-field2 and the Overwrite Field Values checkbox is selected. What happens if an event only contains values for field1?

- **A. field2 values are replaced with the value of the field1.**
- B. field2 values are removed from the events.
- C. field2 values are unchanged.
- D. field1 and field2 values are merged.

정답: A

### 설명:

The correct answer is D. field2 values are replaced with the value of the field1.

A field alias is a way to associate an additional (new) name with an existing field name. A field alias can be used to normalize fields from different sources that have different names but represent the same data. Field aliases can also be used to rename fields for clarity or convenience<sup>1</sup>.

When you create a field alias in Splunk Web, you can select the Overwrite Field Values option to change the behavior of the field alias. This option affects how the Splunk software handles situations where the original field has no value or does not exist, as well as situations where the alias field already exists as a field in your events, alongside the original field<sup>2</sup>.

If you select the Overwrite Field Values option, the following rules apply:

If the original field does not exist or has no value in an event, the alias field is removed from that event.

If the original field and the alias field both exist in an event, the value of the alias field is replaced with the value of the original field.

If you do not select the Overwrite Field Values option, the following rules apply:

If the original field does not exist or has no value in an event, the alias field is unchanged in that event.

If the original field and the alias field both exist in an event, both fields are retained with their respective values.

Therefore, if you create a field alias where field1-field2 and select the Overwrite Field Values option, and an event only contains values for field1, then the value of field2 will be replaced with the value of field1.

### 질문 # 187

Which of the following transforming commands can be used with transactions?

- A. chart, timechart, stats, eventstats
- B. chart, timechart, stats, pivot
- C. chart, timechart, stats, diff
- D. chart, timechart, datamodel, pivot

정답: A

설명:

The correct answer is A. chart, timechart, stats, eventstats.

Transforming commands are commands that change the format of the search results into a table or a chart.

They can be used to perform statistical calculations, create visualizations, or manipulate data in various ways<sup>1</sup>.

Transactions are groups of events that share some common values and are related in some way. Transactions can be defined by using the transaction command or by creating a transaction type in the transactiontypes.conf file<sup>2</sup>.

Some transforming commands can be used with transactions to create tables or charts based on the transaction fields. These commands include:

\* chart: This command creates a table or a chart that shows the relationship between two or more fields. It can be used to aggregate values, count occurrences, or calculate statistics<sup>3</sup>.

\* timechart: This command creates a table or a chart that shows how a field changes over time. It can be used to plot trends, patterns, or outliers<sup>4</sup>.

\* stats: This command calculates summary statistics on the fields in the search results, such as count, sum, average, etc. It can be used to group and aggregate data by one or more fields<sup>5</sup>.

\* eventstats: This command calculates summary statistics on the fields in the search results, similar to stats, but it also adds the results to each event as new fields. It can be used to compare events with the overall statistics.

These commands can be applied to transactions by using the transaction fields as arguments. For example, if you have a transaction type named "login" that groups events based on the user field and has fields such as duration and eventcount, you can use the following commands with transactions:

\* | chart count by user : This command creates a table or a chart that shows how many transactions each user has.

\* | timechart span=1h avg(duration) by user : This command creates a table or a chart that shows the average duration of transactions for each user per hour.

\* | stats sum(eventcount) as total\_events by user : This command creates a table that shows the total number of events for each user across all transactions.

\* | eventstats avg(duration) as avg\_duration : This command adds a new field named avg\_duration to each transaction that shows the average duration of all transactions.

The other options are not valid because they include commands that are not transforming commands or cannot be used with transactions. These commands are:

\* diff: This command compares two search results and shows the differences between them. It is not a transforming command and it does not work with transactions.

\* datamodel: This command retrieves data from a data model, which is a way to organize and categorize data in Splunk. It is not a transforming command and it does not work with transactions.

\* pivot: This command creates a pivot report, which is a way to analyze data from a data model using a graphical interface. It is not a transforming command and it does not work with transactions.

## 질문 # 188

Why would the following search produce multiple transactions instead of one?

```
index-security sourcetype=linux_secure related earliest--evded latest--idea
| transaction src_ip
| stats list(eventcount) as num_events sum(eventcount) as total_events by src_ip
```

src	num_events	total_events
107.3.146.207	1000 1000 1000 405	3405
108.65.113.83	1000 120	1120
109.169.32.135	1000 1000 79	2079
11.17.160.129	1000 1000 238	2238

- A. The maxspan option is not included.
- B. The transaction and commands cannot be used together.
- C. The transaction command has a limit of 1000 events per transaction.
- D. The stats list () function is used.

정답: A

설명:

In Splunk, the transaction command is used to group events that share common characteristics into a single transaction. By default, the transaction command groups all matching events into a single transaction.

However, you can use the maxspan option to limit the time span of the transactions. If the time span between the first and last event in a transaction exceeds the maxspan value, the transaction command will start a new transaction.

Therefore, if the maxspan option is not included in the search, the transaction command might produce multiple transactions instead of one if the time span between the first and last event in a transaction exceeds the default maxspan value.

Here is an example of how you can use the maxspan option in a search:

`index=main sourcetype=access_combined | transaction someuniquefield maxspan=1h` In this search, the transaction command groups events that share the same someuniquefield value into a single transaction, but only if the time span between the first and last event in the transaction does not exceed 1 hour. If the time span exceeds 1 hour, the transaction command will start a new transaction.
