## 100% Pass HP - HPE7-A01 - Newest Exam Aruba Certified Campus Access Professional Exam Simulations

Based on the credibility in this industry, our HPE7-A01 study braindumps have occupied a relatively larger market share and stable sources of customers. Such a startling figure --99% pass rate is not common in this field, but we have made it with our endless efforts. The system of HPE7-A01 test guide will keep track of your learning progress in the whole course. Therefore, you can have 100% confidence in our HPE7-A01 Exam Guide. According to our overall evaluation and research, seldom do we have cases that customers fail the HPE7-A01 exam after using our study materials. But to relieve your doubts about failure in the test, we guarantee you a full refund from our company by virtue of the related proof of your report card. Of course you can freely change another HPE7-A01 exam guide to prepare for the next exam.

HP HPE7-A01 exam is an important certification for IT professionals who want to demonstrate their expertise in wireless networking. It is recognized globally and is highly valued by employers. Aruba Certified Campus Access Professional Exam certification is also a prerequisite for higher-level certifications in Aruba networking, such as the Aruba Certified Mobility Professional (ACMP) and the Aruba Certified Mobility Expert (ACMX). By passing the HPE7-A01 Exam, IT professionals can enhance their career prospects and improve their earning potential.

## HP Aruba Certified Campus Access Professional Exam Sample Questions

## (Q78-Q83):

### NEW QUESTION # 78

A customer wants to provide wired security as close to the source as possible. The wired security must meet the following requirements:

- allow ping from the IT management VLAN to the user VLAN
- deny ping sourcing from the user VLAN to the IT management VLAN

The customer is using Aruba CX 6300s

What is the correct way to implement these requirements?

- A. Apply an inbound ACL on the user VLAN allowing icmp echo-reply traffic toward the IT management VLAN
- B. Apply an outbound ACL on the user VLAN allowing temp echo-reply traffic toward the IT management VLAN
- C. Apply an outbound ACL on the user VLAN denying icmp echo traffic toward the IT management VLAN
- **D. Apply an inbound ACL on the user VLAN denying icmp echo traffic toward the IT management VLAN**

**Answer: D**

Explanation:

An inbound ACL is applied to traffic entering a port or VLAN. An outbound ACL is applied to traffic leaving a port or VLAN<sup>4</sup>. To deny ping sourcing from the user VLAN to the IT management VLAN, an inbound ACL on the user VLAN should be used to filter icmp echo traffic toward the IT management VLAN. Icmp echo-reply traffic is not needed to be allowed because it is already permitted by default<sup>5</sup>. References: 4

### NEW QUESTION # 79

The administrator notices that wired guest users that have exceeded their bandwidth limit are not being disconnected. Access Tracker in ClearPass indicates a disconnect CoA message is being sent to the AOS-CX switch.

An administrator has performed the following configuration

What is the most likely cause of this issue?

- **A. Change of Authorization has not been globally enabled on the switch**
- B. There is a mismatch between the RADIUS secret on the switch and CPPM.
- C. There is a time difference between the switch and the ClearPass Policy Manager
- D. The SSL certificate for CPPM has not been added as a trust point on the switch

**Answer: A**

### NEW QUESTION # 80

Which statement best describes QoS?

- A. Scoring traffic based on the quality of the contents
- **B. Determining which traffic passes specified quality metrics**
- C. Identifying specific traffic for special treatment
- D. Identifying the quality of the connection

**Answer: B**

Explanation:

QoS stands for Quality of Service and is a mechanism that allows network devices to prioritize and differentiate traffic based on certain criteria, such as application type, source, destination, etc.<sup>3</sup>. QoS involves identifying specific traffic for special treatment and applying policies and actions to improve its performance or meet certain service level agreements (SLAs)<sup>3</sup>. QoS can help network devices to manage congestion, delay, jitter, packet loss, bandwidth allocation, etc., for different types of traffic<sup>3</sup>. QoS can be implemented at various layers of the network stack and across different network domains. Reference: 3

### NEW QUESTION # 81

A customer is concerned about me unprotected traffic between an AOS-CX switch and a gateway, running on AOSStO. What is a feasible option to protect this traffic?

- A. Implement a GRE tunnel to protect PAPI between the AOS-CX switches and the gateway
- **B. Implement an IPSec tunnel to protect PAPI between the AOS-CX switches and the gateway**
- C. Implement an MD5 HMAC function to protect PAPI between the AOS-CX switches and the gateway
- D. no action is needed, an RSA certificate already encrypts the traffic

**Answer: B**

Explanation:

According to the Aruba Documentation Portal, PAPI (Port Aggregation Protocol) is a protocol that allows multiple physical ports to be aggregated into a single logical port for increased bandwidth and performance.

PAPI can be used between AOS-CX switches and gateways, or between AOS-CX switches and other devices.

Option A: Implement an IPSec tunnel to protect PAPI between the AOS-CX switches and the gateway This is because option A shows how to implement an IPSec tunnel between two devices using the interface command and the ipsec command. An IPSec tunnel can provide encryption and authentication for PAPI traffic between two devices, such as an AOS-CX switch and a gateway. Therefore, option A is a feasible option to protect this traffic.

I hope this helps you. If you need more information, please let me know.

### NEW QUESTION # 82

Your manufacturing client is having installers deploy seventy headless scanners and fifty IP cameras in their warehouse. These new devices do not support 802.1X authentication.

How can HPE Aruba Networking reduce the IT administration overhead associated with this deployment while maintaining a secure environment using MPSK?

- A. Pre-define the unique pre-shared keys in HPE Aruba Networking Central before deployment.
- **B. Use MPSK Local to automatically provide unique pre-shared keys for devices.**
- C. MPSK Local will allow the cameras to share a key and the scanners to share a different key.
- D. Have the installers generate keys with HPE Aruba Networking ClearPass Self Service Registration.

**Answer: B**

Explanation:

MPSK Local is a feature that can reduce the IT administration overhead associated with deploying devices that do not support 802.1X authentication while maintaining a secure environment. MPSK Local allows the switch to automatically generate and assign unique pre-shared keys for devices based on their MAC addresses, without requiring any configuration on the devices or an external authentication server. The other options are incorrect because they either require manual intervention by the installers or the MPSK gateway, or they do not provide unique pre-shared keys for devices.
