The HashiCorp HCVA0-003 Certification is a valuable certificate that is designed to advance the professional career. With the HashiCorp Certified: Vault Associate (003)Exam (HCVA0-003) certification exam seasonal professionals and beginners get an opportunity to demonstrate their expertise. The HashiCorp Certified: Vault Associate (003)Exam certification exam recognizes successful candidates in the market and provides solid proof of their expertise.

A free demo of the HashiCorp Certified: Vault Associate (003)Exam (HCVA0-003) practice material is available at Pass4suresVCE. You are welcome to try a free demo to remove your doubts before buying our HashiCorp Certified: Vault Associate (003)Exam product. Furthermore, a 24/7 customer support team of Pass4suresVCE is available. If you have any questions in your mind about our HCVA0-003 Study Material, feel free to contact us.

Use Genuine HashiCorp HCVA0-003 Questions for your Exam Preparation

These HashiCorp HCVA0-003 updated dumps are launched in the market after suggestions from experienced professionals. Therefore, this HashiCorp HCVA0-003 exam study material is kept to the point and concise. The HashiCorp HCVA0-003 practice material for Exams. Choice are essential for your successful learning. Often applicants for the exam run on a tight daily schedule before the final HashiCorp HCVA0-003 Exam, so actual HashiCorp Certified: Vault Associate (003)Exam exam questions are fruitful to prepare successfully on the first try.

HashiCorp Certified: Vault Associate (003)Exam Sample Questions (Q36-Q41):

NEW QUESTION # 36

Which of the following unseal options can automatically unseal Vault upon the start of the Vault service?
(Select four)

- A. Transit
- B. Key Shards
- C. Azure KMS
- D. AWS KMS
- E. HSM

Answer: A,C,D,E

Explanation:

Comprehensive and Detailed in Depth Explanation:

Vault supports auto-unseal to simplify operations. The HashiCorp Vault documentation states: "Vault supports opt-in automatic unsealing via cloud technologies: AliCloud KMS, AWS KMS, Azure Key Vault, Google Cloud KMS, and OCI KMS," and includes HSM and Transit as additional options. It explains: "Auto unseal is used to automatically unseal Vault using an HSM or cloud HSM service." The valid options are:

- * A (HSM): "HSM (Hardware Security Module) can automatically unseal Vault by securely storing and managing the master key used for encryption and decryption operations."
- * B (Azure KMS): "Azure KMS can automatically unseal Vault by utilizing Azure Key Management Service to manage the master key."
- * C (AWS KMS): "AWS KMS can automatically unseal Vault upon the start of the service by using AWS Key Management Service to manage the master key."
- * D (Transit): "Transit can automatically unseal Vault by using a pre-configured encryption key stored in Vault itself to encrypt the unseal key." The documentation clarifies: "Key Shards require the user to provide unseal keys to reconstruct the master key," making E (Key Shards) a manual process, not auto-unseal. Thus, A, B, C, and D are correct.

NEW QUESTION # 37

Which of the following is not an action associated with the Transit secrets engine when interacting with data?

- A. encrypt
- B. rewrap
- C. update
- D. decrypt

Answer: C

Explanation:

Comprehensive and Detailed in Depth Explanation:

The Transit secrets engine focuses on cryptographic operations, not data storage or modification. The HashiCorp Vault

documentation states: 'The transit secrets engine handles cryptographic functions on data in-transit. Vault doesn't store the data sent to the secrets engine. It can also be viewed as 'cryptography as a service' or 'encryption as a service'. The transit secrets engine can also sign and verify data; generate hashes and HMACs of data; and act as a source of random bytes.' It further notes: 'You can, however, rewrap data when the key has been rotated to ensure data is encrypted with the latest version.' Supported actions include encrypt, decrypt, andrewrap, but update is not a function, as Transit doesn't store or modify data. Thus, D is correct.

NEW QUESTION # 38

Your organization operates active/active applications across multiple data centers for high availability. Which Vault feature should be used in the secondary data centers to provide local access to secrets?

- A. Disaster recovery cluster
- **B. Performance replication cluster**
- C. Performance standby nodes
- D. Customized plugins for the Vault cluster

Answer: B

Explanation:

Comprehensive and Detailed In-Depth Explanation:

For active/active setups:

* D. Performance replication cluster: "Should be used in an active/active scenario to ensure applications in both data centers can easily access Vault secrets."

* Incorrect Options:

* A: Scales single cluster, not multi-DC.
* B, C: Not suited for local access.

NEW QUESTION # 39

Which of the following describes the Vault's auth method component?

- A. It dynamically generates a unique set of secrets with appropriate permissions attached
- B. It is responsible for durable storage of client tokens
- C. It verifies a client against an internal or external system, and generates a token with root policy
- **D. It verifies a client against an internal or external system, and generates a token with the appropriate policies attached**

Answer: D

Explanation:

The Vault's auth method component is the component that performs authentication and assigns identity and policies to a client. It verifies a client against an internal or external system, and generates a token with the appropriate policies attached. The token can then be used to access the secrets and resources that are authorized by the policies. Vault supports various auth methods, such as userpass, ldap, aws, kubernetes, etc., that can integrate with different identity providers and systems. The auth method component can also handle token renewal and revocation, as well as identity grouping and aliasing. NEW QUESTION # 40

Which statement best describes the process of sealing a Vault instance?

- A. Revoke all leases so no secrets can be accessed using vault lease revoke, but keep the master key in memory for quick recovery.
- B. Disable the TLS certificates on the Vault server by running vault secrets disable pki, blocking all requests.
- C. Run vault operator rotate to rotate the Vault tokens for all clients, causing them to reauthenticate with the Vault.
- **D. Run the vault operator seal command, which securely discards the master key from memory and prevents further operations until unsealed.**

Answer: D

Explanation:

Comprehensive and Detailed in Depth Explanation:

Sealing a Vault instance is a critical security operation that involves locking down the system to prevent access until it is explicitly unsealed. The HashiCorp Vault documentation states: "Sealing a Vault will throw away the root key in memory and require another unseal process to restore it." This is achieved by running the vault operator seal command, which "securely discards the master key from memory and prevents further operations until unsealed." This action ensures that no data can be accessed without the unseal process, making it the correct description of sealing.

Disabling TLS certificates via vault secrets disable pki affects the PKI secrets engine, not the sealing process.

Running vault operator rotate rotates encryption keys, not seals the Vault. Revoking leases with vault lease revoke terminates secret access but keeps the master key in memory, unlike sealing, which discards it. Thus, only option C accurately reflects the sealing process.
