Plat-Admn-202 Exam Sample Questions | New Plat-Admn-202 Exam Pattern

All questions in our Salesforce Plat-Admn-202 pass guide are at here to help you prepare for the certification exam. We have developed our learning materials with accurate Salesforce Plat-Admn-202 exam answers and detailed explanations to ensure you pass test in your first try. Our PDF files are printable that you can share your Salesforce Plat-Admn-202 free demo with your friends and classmates.

Salesforce Certified Platform App Builder Sample Questions (Q292-Q297):

NEW QUESTION # 292

Which three Salesforce functionalities are ignored when processing field updates in workflow rules and approval processes?

- A. Decimal places and character limits

- B. Record type picklist value assignments
- C. **Field-Level Security**
- D. **Validation Rules**
- E. Multiple currencies

Answer: A,C,D

Explanation:

The three Salesforce functionalities that are ignored when processing field updates in workflow rules and approval processes are:

Field-Level Security: This means that the field update will occur regardless of the user's profile or permission set settings that determine whether they can see or edit the field1.

Validation Rules: This means that the field update will bypass any validation rules that might otherwise prevent the record from being saved1.

Decimal places and character limits: This means that the field update will round or truncate the value to fit the field's format, without throwing an error

NEW QUESTION # 293

Universal Containers uses a private sharing model on Accounts. User A and user B both own Accounts of their own and have both been sent a new account record in an email owned by user C to take a look at. User A is able to open and view the record but user B receives an insufficient privileges error. User A and user B have the same role in the role hierarchy as user.

What are the three reasons user A has access but user B is unable to access the record? Choose 3 answers

- A. User A is on the same account team as user C.
- B. User A was granted an additional permission set.
- C. **User C has manually shared the record with user A.**
- D. **User A is in a public group that has access via a sharing rule.**
- E. User A and user B have different profiles.

Answer: A,C,D

Explanation:

The three reasons user A has access but user B is unable to access the record are:

User A is on the same account team as user C. Account teams are groups of users who work together on an account. Users who are on an account team can have access to the account and related records owned by other team members.

User C has manually shared the record with user A. Manual sharing is a way of granting access to individual users or groups by the record owner or someone above them in the role hierarchy.

User A is in a public group that has access via a sharing rule. Public groups are groups of users who can be used to share data or assign permissions. Sharing rules are automatic rules that grant access to groups of users based on certain criteria. Option B and D are not reasons for user A's access.

NEW QUESTION # 294

DreamHouse Realty (DR) has many properties for sale and wants to identify the highest value of all Offer__c records on each Property__c record.

What solution should the app builder use to meet DreamHouse Realty's needs?

- A. Text Area (Long)
- B. **Master-Detail Child Object**
- C. Multi-select Picklist
- D. Lookup Object

Answer: B

Explanation:

The solution that the app builder should use to meet DreamHouse Realty's needs is Master-Detail Child Object. A master-detail relationship can be used to create a parent-child relationship between two objects, where the child records inherit the sharing and security settings of their parent record. The app builder can create a roll-up summary field on the parent object to calculate the highest value of all child records. Option B is incorrect because Text Area (Long) is a field type that allows users to enter up to 131,072 characters on one line, which is not suitable for this requirement. Option C is incorrect because Multi-select Picklist is a field type that allows users to select multiple values from a predefined list, which is not suitable for this requirement. Option D is

incorrect because Lookup Object is not a valid term, but rather Lookup Relationship, which is a type of relationship that links two objects together, but does not support roll-up summary fields.

NEW QUESTION # 295

Cloud Kicks is redefining its entire business process to convert the Manager Notes field from a long text area field. The goal is to encourage managers to be more concise in their comments and stay at 255 characters or less. There is preexisting information in the Manager Notes field that often is well beyond the character limit.

What would happen to any existing information if the app builder tries to convert a preexisting long text area field to text area?

- A. Preexisting information in the field will be completely lost.
- B. Preexisting information will cause a error message to pop up.
- C. Preexisting information will remain even if it was over 255 characters.
- D. Preexisting information will truncate to the first 255 characters.

Answer: D

Explanation:

If the app builder tries to convert a preexisting long text area field to text area, preexisting information will truncate to the first 255 characters. This means that any information beyond 255 characters will be lost. Option B is incorrect because preexisting information will not remain if it was over 255 characters. Option C is incorrect because preexisting information will not cause an error message to pop up. Option D is incorrect because preexisting information in the field will not be completely lost, only truncated.

NEW QUESTION # 296

Cloud Kicks (CK) keeps track of its shoe inventory in Salesforce. When an order's status is changed to Activated, the inventory for the ordered shoe is reduced. At that point, a SOAP web service on the CK website must be called so that the website is updated to display the correct inventory amount for the shoe.

What should an app builder use to communicate to the CK web service when a shoe's inventory has changed?

- A. After-Save Record-Triggered flow
- B. Process Builder
- C. Before-Save Record-Triggered flow
- D. Workflow rule

Answer: A

Explanation:

To communicate to the CK web service when a shoe's inventory has changed, an app builder should use an after-save record-triggered flow. An after-save record-triggered flow is a type of flow that runs after a record is saved and can perform actions such as updating related records, sending emails, calling external services, etc. An after-save record-triggered flow can use an Apex action to invoke a SOAP web service using a WSDL file.
