EMT Quiz & EMT Test Sample Online

The NREMT EMT practice material of Dupleader came into existence after consultation with many professionals and getting their positive reviews. The majority of aspirants are office professionals, and we recognize that you don't have enough time to prepare for the NREMT EMT Certification Exam. As a result, several versions of the Emergency Medical Technicians Exam (EMT) exam questions will be beneficial to you.

NREMT Emergency Medical Technicians Exam Sample Questions (Q39-Q44):

NEW QUESTION # 39

A 58-year-old patient reports chest pain and difficulty breathing after missing their last three hemodialysis treatments. Which of the following signs and symptoms should the EMT suspect to find?

- A. Crackles
- B. Hypotension
- C. Bradycardia
- D. Fever

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Missing dialysis leads to fluid overload, causing:

- * Pulmonary edema, evident by crackles on auscultation
- * Dyspnea and chest discomfort

Bradycardia is less likely; patients more often present with tachycardia due to volume stress. Fever would suggest infection (not stated here), and hypotension can occur later, but hypertension is more common in early fluid overload.

National Kidney Foundation Guidelines - Missed Dialysis and Pulmonary Symptoms AAOS EMT Textbook - Urologic and Fluid Volume Imbalance

NEW QUESTION # 40

A 67-year-old patient reports crushing chest pressure. The vital signs are BP 156/98, P 64, R 14, and SpO₂ 94%. What treatments should the EMT provide first? Select the two correct options.

- A. Lay the patient supine
- **B. Give aspirin**
- C. Assist with nitroglycerin
- **D. Administer oxygen**
- E. Apply CPAP

Answer: B,D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The patient's symptoms are consistent with acute coronary syndrome (ACS). The first-line treatments are:

- * Aspirin (160-325 mg): inhibits platelet aggregation, reducing clot progression.
- * Oxygen: administered when SpO₂ <94% or signs of hypoxia/distress are present.

CPAP is for pulmonary edema or respiratory failure. Nitroglycerin requires BP >90 systolic and medical direction approval. Laying the patient supine may increase myocardial workload and is inappropriate unless hypotension occurs.

NEW QUESTION # 41

A 32-year-old female has a history of dysmenorrhea, abdominal pelvic pain, and pain when having a bowel movement. She has not been sexually active in 8 months. Her symptoms are most likely caused by

- A. Spontaneous abortion
- B. An infection that is either bacteria or a virus
- C. Premature menopause
- **D. Endometrial tissue growing outside the uterus**

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

These symptoms are classic for endometriosis, where endometrial tissue grows outside the uterus.

Symptoms often include:

- * Pelvic pain
- * Painful menstruation (dysmenorrhea)
- * Painful bowel movements or intercourse

Spontaneous abortion does not apply here due to lack of pregnancy. Premature menopause is rare at this age and presents differently. Infection is less likely in the absence of recent sexual activity or fever.

ACOG Guidelines on Endometriosis

NEW QUESTION # 42

Which of the following conditions would most likely result in pulmonary edema? Select the two correct options.

- A. Severe anaphylaxis
- B. Left-sided heart failure
- C. Hypertensive crisis
- D. Increased oncotic pressure
- E. Aortic dissection

Answer: B,C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Pulmonary edema is caused by fluid accumulation in the alveoli, impairing gas exchange. It is typically due to:

* Left-sided heart failure: Blood backs up into the pulmonary circulation

* Hypertensive crisis: Increases hydrostatic pressure in the lungs

Anaphylaxis causes vasodilation and bronchospasm, not fluid overload. Increased oncotic pressure would retain fluid in capillaries - the opposite of edema.

AAOS EMT Textbook - Pathophysiology of Pulmonary Edema

NEW QUESTION # 43

A 3-year-old female choked while eating a hot dog and then became unresponsive. You should first

- A. Check her carotid pulse
- B. Deliver two rescue breaths
- C. Perform a head tilt-chin lift maneuver
- D. Begin chest compressions

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

According to Pediatric Basic Life Support (PBLIS) guidelines by the American Heart Association (AHA), when a child becomes unresponsive due to foreign body airway obstruction (FBAO), the immediate next step is to begin chest compressions. This is done before checking the airway or giving rescue breaths because the airway is presumed obstructed. The compressions may dislodge the object.

After 30 compressions, open the airway and check for visible objects. If none are seen, attempt rescue breaths.

This protocol reflects the high risk of complete airway blockage in children with sudden collapse following a choking episode.
