Salesforce Certified MuleSoft Integration Associate Exam Sample Questions (Q15-Q20):

NEW QUESTION # 15

What is an advantage of using OAuth 2.0 client credentials and access tokens over only API keys for API authentication?

- A. If the access token is compromised it can be exchanged for an API key
- B. If the client secret is compromised, the client credentials do not have to be reissued
- **C. If the access token is compromised, the client credentials do not have to be reissued**
- D. If the client ID is compromised it can be exchanged for an API key

Answer: C

Explanation:

OAuth 2.0 provides a more secure and flexible way of handling API authentication compared to API keys.

Here's a detailed explanation of the advantage mentioned:

* OAuth 2.0 Client Credentials Grant:

* How It Works: In this flow, a client application uses its client ID and client secret to obtain an access token from the authorization server.

* Access Tokens: These tokens are short-lived and used to authenticate API requests.

* Security Advantages:

* Token Compromise: If an access token is compromised, it only grants limited access because it has a short lifespan and can be easily revoked.

* Client Credentials: The client credentials (client ID and secret) are not exposed during API calls, reducing the risk of them being compromised.

* Token Refresh: New tokens can be obtained without exposing the client credentials again.

* Comparison with API Keys:

* API Keys: If an API key is compromised, it often provides long-term access without expiration.

Revoking the API key impacts all users or applications using it.

* OAuth Tokens: Compromised tokens can be individually revoked without needing to change the client credentials, minimizing disruption.

NEW QUESTION # 16

A platform architect includes both an API gateway and a service mesh in the architecture of a distributed application for communication management.

Which type of communication management does a service mesh typically perform in this architecture?

- A. Between application services and the firewall
- **B. Between services within the application**
- C. Between the application and external API clients
- D. Between the application and external API implementations

Answer: B

Explanation:

A service mesh is typically used to manage communication between microservices within a distributed application. Here's a detailed explanation:

* Service Mesh:

* Definition: A service mesh is a dedicated infrastructure layer that manages service-to-service communication within a microservices architecture.

* Features: Provides features such as load balancing, service discovery, traffic management, and security (e.g., mutual TLS).

* Intra-Application Communication:

* Focus: It focuses on internal communication between microservices, ensuring reliability, security, and observability of inter-service communications.

* Management: Handles retries, circuit breaking, and service-to-service authentication transparently.

* API Gateway:

* Complementary Role: While a service mesh manages internal microservice communications, an API gateway manages external client requests and provides a single entry point for external API clients.

NEW QUESTION # 17

Which key DevOps practice and associated Anypoint Platform component should a MuleSoft integration team adopt to improve delivery quality?

- A. Passive monitoring with Anypoint Monitoring
- B. Continuous design with API Designer
- C. Manual testing with Anypoint Studio
- **D. Automated testing with MUnit**

Answer: D

Explanation:

To improve delivery quality, a key DevOps practice is automated testing. Within the Anypoint Platform, MUnit is the tool specifically designed for this purpose. Here's a step-by-step explanation:

* Automated Testing:

* Definition: Automated testing involves using software tools to execute tests on the application automatically, ensuring that the code works as expected.

* Benefits: It increases efficiency, consistency, and coverage of tests, reducing the risk of human error.

* MUnit:

* Integration Testing: MUnit is MuleSoft's integrated testing framework for applications built with Anypoint Studio. It allows developers to create and run tests for Mule applications, ensuring they function correctly.

* Features:

* Test Cases: Create comprehensive test cases to validate various parts of the Mule application.

* Mocking: Mock external systems and dependencies, enabling isolated testing of application components.

* Assertions: Validate the behavior of Mule flows with assertions.

* Implementation Steps:

* Design Tests: Within Anypoint Studio, design MUnit tests to cover different scenarios and edge cases of the Mule flows.

* Run Tests: Execute these tests automatically during the CI/CD pipeline to ensure that new code changes do not break existing functionality.

* Continuous Integration: Integrate MUnit tests with CI tools like Jenkins, Bamboo, or GitLab CI for continuous testing.

NEW QUESTION # 18

An API client makes an HTTP request to an API gateway with an Accept header containing the value "application/json"

What is a valid HTTP response payload for this request in the client's requested data format?

- **A. {"status" -healthy-}**
- B. status('healthy')
- C. <status>healthy<'status>
- D. status: healthy

Answer: A

Explanation:

When an API client makes an HTTP request with an Accept header containing the value "application/json", the API server should respond with a payload formatted as JSON. Here's a detailed explanation:

* Accept Header:

* Purpose: The Accept header indicates the media type(s) that the client is willing to receive from the server.

* Value "application/json": Specifies that the client expects a response in JSON format.

* Valid JSON Response:

* Format: JSON (JavaScript Object Notation) is a lightweight data interchange format that uses key-value pairs.

* Example: A valid JSON response for the requested format would be {"status": "healthy"}.

* Key: "status"

* Value: "healthy"
