Juniper Junos, Associate (JNCIA-Junos) Sample Questions (Q13-Q18):

NEW QUESTION # 13

What does the Junos CLI prompt indicate when it ends with a hash symbol (#)?

- A. The user is in recovery mode
- B. The user is in operational mode.
- C. The user is in shell mode.
- **D. The user is in configuration mode.**

Answer: D

Explanation:

In the Junos OS, the Command Line Interface (CLI) uses distinct prompt symbols to provide the administrator with immediate contextual awareness of their current operating environment. When the prompt ends with a hash symbol (#), it indicates that the user is in configuration mode.

This mode is the "engine room" of the device, where you modify the candidate configuration. Here, you can add, delete, or modify statements across the various hierarchies like [edit system], [edit interfaces], or [edit protocols]. It is important to remember that changes made while the # prompt is visible are not active until a commit command is successfully executed.

Contrast this with the operational mode, which is indicated by a greater-than symbol (>). Operational mode is used for

monitoring, troubleshooting, and viewing the system status (e.g., show commands). Moving between these modes is a fundamental part of the Junos workflow: you enter configuration mode by typing configure and return to operational mode by typing exit or quit. If you see a percent sign (%), you've wandered into the FreeBSD shell mode, which is a lower-level Unix environment typically reserved for advanced system maintenance. Recognizing that # means you have the power to change the system's "brain" is a key safety check for any network architect.

NEW QUESTION # 14

You want to configure the management port on a Juniper device. In this scenario, what is the management interface name?

- A. mtun0
- B. mt0
- C. fxp0
- D. st0

Answer: C

Explanation:

On Juniper devices, the management interface is named fxp0 and is used for out-of-band management access.

NEW QUESTION # 15

You issue the monitor traffic interface ge-0/0/0 command. What will this command accomplish?

- A. It displays a packet capture on interface ge-0/0/0.
- B. It displays the MTU and MAC address for ge-0/0/0.
- C. It displays real-time statistics for interface ge-0/0/0.
- D. It displays an operational summary of ge-0/0/0.

Answer: A

Explanation:

The command "monitor traffic interface ge-0/0/0" (D) initiates a packet capture on the specified interface, allowing you to view the actual packets being transmitted and received. This is useful for troubleshooting and analyzing the traffic passing through the interface in real time.

NEW QUESTION # 16

Which Junos feature limits the amount of exception traffic that is sent from the PFE to the RE?

- A. routing policy
- B. scheduler
- C. CoS markings
- D. policer

Answer: D

Explanation:

In Junos OS, a policer is a feature used to limit the rate of traffic flow in the network, including exception traffic sent from the Packet Forwarding Engine (PFE) to the Routing Engine (RE).

Exception traffic consists of packets that cannot be processed by the PFE alone and require intervention by the RE, such as control packets or packets destined for the device itself. A policer can be configured to enforce bandwidth limits and drop or mark packets that exceed specified rate limits, thus protecting the RE from being overwhelmed by excessive exception traffic.

NEW QUESTION # 17

Which two protocols use UDP to facilitate speed? (Choose two.)

- A. SCP

- B. OFTP
- C. TFTP
- D. SNMP

Answer: C,D
