

2V0-15.25 Exam Introduction, Latest 2V0-15.25 Exam Book

VMware 2V0-15.25 Exam
VMware Cloud Foundation 9.0 Support
<https://www.passquestion.com/2v0-15-25.html>

Pass VMware 2V0-15.25 Exam with PassQuestion 2V0-15.25 questions and answers in the first attempt.
<https://www.passquestion.com/>

Dear customers, we would like to make it clear that learning knowledge and striving for certificates of exam is a self-improvement process, and you will realize yourself rather than offering benefits for anyone. So our 2V0-15.25 practice materials are once a lifetime opportunity you cannot miss. With all advantageous features introduced as follow, please read them carefully.

VMware 2V0-15.25 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Plan and Design the VMware by Broadcom Solution: This domain addresses architectural planning and design principles for creating scalable, secure virtual environments aligned with business requirements.
Topic 2	<ul style="list-style-type: none">VMware by Broadcom Solution: This section focuses on understanding VMware by Broadcom's virtualization and cloud infrastructure platform for managing modern enterprise workloads.
Topic 3	<ul style="list-style-type: none">Install, Configure, Administrate the VMware by Broadcom Solution: This area covers installing, configuring, and managing VMware solutions including VCF Fleet deployment, expansion, and reduction operations.

Topic 4	<ul style="list-style-type: none"> • Troubleshoot and Optimize the VMware by Broadcom Solution: This domain focuses on troubleshooting VCF deployment, upgrades, conversions, workload domains, fleet operations (certificates, passwords, identity), licensing, compute resources, storage (vSAN, supplemental storage), networking (VDS, NSX), VCF Operations tools, Identity Broker automation, and HCX workload migrations.
Topic 5	<ul style="list-style-type: none"> • IT Architectures, Technologies, Standards: This domain covers fundamental frameworks, tools, and best practices for building scalable, secure, and interoperable enterprise IT systems.

Latest 2V0-15.25 Exam Book & 2V0-15.25 Reliable Test Questions

As our loyal customers wrote to us that with the help of our 2V0-15.25 exam questions, they have successfully passed the exam and achieved the certification. They are now living the life they desired before. While you are now hesitant for purchasing our 2V0-15.25 Real Exam, some people have already begun to learn and walk in front of you! So what you should do is to make the decision to buy our 2V0-15.25 practice engine right now. The time and tide wait for no man!

VMware Cloud Foundation 9.0 Support Sample Questions (Q56-Q61):

NEW QUESTION # 56

An administrator discovers that a VMware Cloud Foundation (VCF) workload domain four-node vSAN cluster is experiencing a network partition. The workload domain vCenter displays a "vSAN cluster partition" warning. The performance across the cluster is degraded and the objects are showing as non-compliant.

What could be causing the network partition?

- A. Jumbo frames are configured on the vSphere distributed switch (VDS).
- B. IGMP snooping is disabled on the multicast group.
- C. The VLAN was changed on the physical switch port.
- D. The vSAN Witness service was added to the vMotion network.

Answer: C

Explanation:

A vSAN cluster network partition occurs when vSAN nodes cannot communicate over the designated vSAN network. In VMware Cloud Foundation workload domains, the vSAN network relies on L2 adjacency, consistent VLAN configuration, and stable multicast/BUM behavior (in older versions). VCF 9.0 uses unicast-mode vSAN, so multicast-related issues (such as IGMP snooping configuration) are no longer relevant.

A network partition can occur when the VLAN ID on the physical switch port differs from the VLAN configured on the vSphere Distributed Switch (VDS) for the vSAN VMkernel adapters. The documentation emphasizes that consistent VLAN configuration across the physical and virtual network is required for proper vSAN cluster communication. If a switch port is reconfigured-intentionally or accidentally-to use a different VLAN, the node becomes isolated from the rest of the vSAN cluster, causing:

* "vSAN cluster partition" warnings in vCenter

* degraded performance

* objects marked as non-compliant

* resyncs that cannot complete

Option A (IGMP snooping) does not apply because modern vSAN uses unicast, not multicast.

Option C (Jumbo frames) would cause packet loss only if inconsistently configured, but it does not cause a full network partition.

Option D (vSAN Witness on vMotion) is relevant only for stretched clusters and does not cause a partition in a standard four-node cluster.

NEW QUESTION # 57

An administrator is managing a VMware Cloud Foundation (VCF) environment. They receive a request from the developers to enable vDefend - Distributed Firewall. However, they noticed it cannot be enabled due to a missing license.

Where must the new license be applied?

- A. VCF Operations.

- B. NSX Manager.
- C. VCF Automation.
- D. SDDC Manager.

Answer: B

Explanation:

vDefend - Distributed Firewall is a security capability delivered by NSX within VMware Cloud Foundation.

Although VCF components such as SDDC Manager, VCF Operations, and VCF Automation rely on licensing frameworks, the enforcement and activation of NSX features-including Distributed Firewall-occur entirely within NSX Manager.

To enable vDefend (Distributed Firewall), NSX Manager must detect a valid NSX license that includes security features. Without applying the correct license directly to NSX Manager:

- * The Distributed Firewall feature remains locked
- * vDefend cannot be enabled in workload domains
- * Security rules and micro-segmentation capability remain unavailable

VCF does not apply NSX security licensing at the SDDC Manager, VCF Automation, or VCF Operations layers. Instead, NSX Manager handles all feature entitlement checks internally.

Therefore, the new license must be installed directly in NSX Manager, under:

System # Licensing # NSX # Add License

Options A, C, and D are incorrect because none of those components control NSX feature activation.

NEW QUESTION # 58

An administrator logs into the VMware NSX Manage UI and observes a "Remote Logging Not Configured" alarm for each NSX Management node. What is a possible reason for this issue?

- A. Update the NSX Node Profile to configure a remote logging server.
- B. Update the NSX Edge Cluster Profile to configure a remote logging server.
- C. Update the NSX Configuration Profile to configure a remote logging server.
- D. Update the NSX Uplink Profile to configure a remote logging server.

Answer: A

Explanation:

The "Remote Logging Not Configured" alarm in NSX Manager is a system-health alert indicating that one or more Transport Nodes (Edges or Hypervisors) or Management Nodes do not have a Syslog server defined.

* NSX Node Profiles: In VMware NSX (and by extension VCF), the standard method to apply consistent administrative settings-such as Syslog Servers, NTP settings, and Core Dump configurations-across a fleet of nodes is to use an NSX Node Profile.

* Configuration Path: The administrator should navigate to System > Fabric > Profiles > Node Profiles

. Here, they can create or edit a profile that specifies the remote syslog server's IP/FQDN, port, and protocol.

* Application: Once the Node Profile is applied to the NSX Management Cluster or Edge Clusters, the configuration is pushed to all respective appliances, clearing the alarm.

* Why not A/B: Edge Cluster Profiles manage networking/BFD settings; Uplink Profiles manage NIC teaming and MTU.

NEW QUESTION # 59

An administrator has successfully deployed and configured the Application Monitoring Telegraf Agent to 30 virtual machines through VMware Cloud Foundation (VCF) Operations.

After 24 hours, the administrator is alerted to the fact that no additional data has been collected since the agents were deployed on the virtual machines.

What could be the possible cause of the issue?

- A. Application monitoring has been configured to use a single Cloud Proxy rather than a Collector Group.
- B. There is a time synchronization issue between the Telegraf Agent and the Cloud Proxy.
- C. There is a compatibility issue between the version of Virtual Machine Hardware and VMware Tools.
- D. The Service Discovery Management Pack has not been configured.

Answer: B

Explanation:

Application Monitoring in VCF Operations uses Telegraf agents running inside virtual machines. These agents forward metrics to

the Cloud Proxy, which then sends them to the Operations analytics cluster. One of the most common reasons an agent stops reporting data—especially exactly 24 hours after deployment—is clock drift or time mismatch between the VM (running the Telegraf agent) and the Cloud Proxy.

VCF Operations enforces strict timestamp validation. If the timestamps from the agent are outside the acceptable drift window, the Cloud Proxy rejects incoming data as invalid. In this case, the Telegraf agents appear installed and functional, but no new metrics are received by the analytics engine.

This is a well-known issue documented in VMware Aria/VCF Operations agent-based monitoring, where:

* Agents send metrics with local system time.

* Cloud Proxy enforces time validation to prevent corrupt metric ingestion.

* A drift >5 minutes commonly results in zero data collection despite healthy connectivity.

Options B and C cannot stop data flow after exactly 24 hours; they would prevent initial collection. Option D (virtual hardware/tools compatibility) affects VM operations but not Telegraf metric time-stamp validation.

NEW QUESTION # 60

An administrator is attempting to log into the vCenter using the vSphere Client but receives an error stating "no healthy upstream" What are two possible causes for this? (Choose two.)

- A. Port 443 is not opened between the local machine and the vCenter.
- B. The vmware-rbd-watchdog service is not running.
- C. The administrator logged in with the root account.
- **D. The vpxd service is not running.**
- **E. The SSO Service is not running.**

Answer: D,E

Explanation:

The vSphere Client "no healthy upstream" error is a classic indicator that one or more vCenter backend services are not running or responding, preventing the reverse proxy layer (envoy / nginx) from routing requests to the appropriate upstream services.

Two services in particular are known root causes:

A). vpxd service not running

vpxd is the core vCenter Server service responsible for inventory, host management, and client interaction. If vpxd is stopped, crashed, or restarting, the vSphere Client cannot communicate with backend APIs, resulting in the "no healthy upstream" condition.

B). SSO (vmware-stsd / identity service) not running

Authentication in vCenter depends on the SSO/Identity service. If SSO is unavailable, login sessions cannot be validated, and vCenter marks the upstream service as unhealthy.

Other options do not match the behavior:

* C (Port 443 closed) would produce a connection failure, not the upstream error.

* D (logging in with root) is fully supported and does not trigger this message.

* E (vmware-rbd-watchdog) relates to backup/restore health, not core authentication/management planes.

NEW QUESTION # 61

.....

Our 2V0-15.25 practicing materials is aimed at promote the understanding for the exam. We have free demo for you to comprehend the format of 2V0-15.25 exam dumps. After you pay for the 2V0-15.25 exam dumps, we will send you the downloading linking and password within ten minutes, and if you have any other questions, please don't hesitate to contact us, we are very glad to help you solve the problems.
