

# Perfect Amazon Pdf Free—First-grade SAP-C02 Practical Information

2026 Latest PDFVCE SAP-C02 PDF Dumps and SAP-C02 Exam Engine Free Share: <https://drive.google.com/open?id=1WpeeAKKFfjnQMp088u64IX7ILZoc779j>

Before the clients purchase our SAP-C02 study practice guide, they can have a free trial freely. The clients can log in our company's website and visit the pages of our products. The pages of our products lists many important information about our SAP-C02 exam materials and they include the price, version and updated time of our products, the exam name and code, the total amount of the questions and answers, the merits of our SAP-C02 useful test guide and the discounts. You can have a comprehensive understanding of our SAP-C02 useful test guide after you see this information.

To prepare for the SAP-C02 exam, candidates can take advantage of various resources provided by AWS, including training courses, practice exams, and whitepapers. They can also join study groups and participate in online forums to exchange knowledge and experiences with other professionals. With proper preparation and experience, passing the SAP-C02 exam can be a rewarding achievement for AWS professionals.

The SAP-C02 exam covers a broad range of topics related to AWS architecture and services, including designing and deploying enterprise-wide scalable operations on AWS, selecting appropriate AWS services to meet specific application and business requirements, designing and deploying fault-tolerant and highly available systems on AWS, and migrating complex multi-tier applications to AWS. SAP-C02 Exam also covers advanced topics such as designing and implementing hybrid architectures that integrate on-premises infrastructure with AWS cloud services, designing and implementing security and compliance policies on AWS, and designing and implementing cost-optimized solutions on AWS.

**SAP-C02 Practical Information & Reliable SAP-C02 Dumps Free**

With years of experience in compiling top-notch relevant Amazon SAP-C02 dumps questions, we also offer the Amazon SAP-C02 practice test (online and offline) to help you get familiar with the actual exam environment. Therefore, if you have struggled for months to pass Amazon SAP-C02 Exam, be rest assured you will pass this time with the help of our Amazon SAP-C02 exam dumps. Every SAP-C02 exam candidate who has used our exam preparation material has passed the exam with flying colors.

Amazon SAP-C02 (AWS Certified Solutions Architect - Professional) certification exam is a highly sought-after certification for IT professionals who are looking to validate their expertise in designing and deploying scalable, fault-tolerant, and highly available systems on the Amazon Web Services (AWS) platform. AWS Certified Solutions Architect - Professional (SAP-C02) certification is intended for individuals who have already achieved the AWS Certified Solutions Architect - Associate certification and have significant experience designing and deploying AWS solutions.

## Amazon AWS Certified Solutions Architect - Professional (SAP-C02) Sample Questions (Q221-Q226):

### NEW QUESTION # 221

An events company runs a ticketing platform on AWS. The company's customers configure and schedule their events on the platform. The events result in large increases of traffic to the platform. The company knows the date and time of each customer's events. The company runs the platform on an Amazon Elastic Container Service (Amazon ECS) cluster. The ECS cluster consists of Amazon EC2 On-Demand Instances that are in an Auto Scaling group. The Auto Scaling group uses a predictive scaling policy. The ECS cluster makes frequent requests to an Amazon S3 bucket to download ticket assets. The ECS cluster and the S3 bucket are in the same AWS Region and the same AWS account. Traffic between the ECS cluster and the S3 bucket flows across a NAT gateway. The company needs to optimize the cost of the platform without decreasing the platform's availability. Which combination of steps will meet these requirements? (Select TWO)

- A. Add another ECS capacity provider that uses an Auto Scaling group of Spot Instances. Configure the new capacity provider strategy to have the same weight as the existing capacity provider strategy.
- B. Replace the predictive scaling policy with scheduled scaling policies for the scheduled events.
- C. Enable S3 Transfer Acceleration on the S3 bucket.
- D. Create a gateway VPC endpoint for the S3 bucket.
- E. Create On-Demand Capacity Reservations for the applicable instance type for the time period of the scheduled scaling policies.

**Answer: A,D**

Explanation:

\* Gateway VPC Endpoint for S3:

\* Create a gateway VPC endpoint for Amazon S3 in your VPC. This allows instances in your VPC to communicate with Amazon S3 without going through the internet, reducing data transfer costs and improving security.

\* Add Spot Instances to ECS Cluster:

\* Add another ECS capacity provider that uses an Auto Scaling group of Spot Instances. Configure this new capacity provider to share the load with the existing On-Demand Instances by setting an appropriate weight in the capacity provider strategy. Spot Instances offer significant cost savings compared to On-Demand Instances.

\* Configure Capacity Provider Strategy:

\* Adjust the ECS service's capacity provider strategy to utilize both On-Demand and Spot Instances effectively. This ensures a balanced distribution of tasks across both instance types, optimizing cost while maintaining availability.

By implementing a gateway VPC endpoint for S3 and incorporating Spot Instances into the ECS cluster, the company can significantly reduce operational costs without compromising on the availability or performance of the platform.

### NEW QUESTION # 222

A company standardized its method of deploying applications to AWS using AWS CodePipeline and AWS CloudFormation. The applications are in Typescript and Python. The company has recently acquired another business that deploys applications to AWS using Python scripts.

Developers from the newly acquired company are hesitant to move their applications under CloudFormation because it would require them to learn a new domain-specific language and eliminate their access to language features, such as looping.

How can the acquired applications quickly be brought up to deployment standards while addressing the developers' concerns?

- A. Define the AWS resources using Typescript or Python. Use the AWS Cloud Development Kit (AWS CDK) to create

CloudFormation templates from the developers' code, and use the AWS CDK to create CloudFormation stacks. Incorporate the AWS CDK as a CodeBuild job in CodePipeline.

- B. Create CloudFormation templates and re-use parts of the Python scripts as instance user data. Use the AWS Cloud Development Kit (AWS CDK) to deploy the application using these templates. Incorporate the AWS CDK into CodePipeline and deploy the application to AWS using these templates.
- C. Standardize on AWS OpsWorks. Integrate OpsWorks with CodePipeline. Have the developers create Chef recipes to deploy their applications on AWS.
- D. Use a third-party resource provisioning engine inside AWS CodeBuild to standardize the deployment processes of the existing and acquired company. Orchestrate the CodeBuild job using CodePipeline.

**Answer: A**

Explanation:

Explanation

[https://docs.aws.amazon.com/cdk/latest/guide/codepipeline\\_example.html](https://docs.aws.amazon.com/cdk/latest/guide/codepipeline_example.html)

By using the AWS CDK, the developers can define the AWS resources using the familiar Typescript or Python programming languages, rather than learning a new domain-specific language like CloudFormation.

The AWS CDK then generates the CloudFormation templates, allowing the company to standardize on CloudFormation for deployment while still leveraging the developers' expertise in Typescript or Python. The AWS CDK can be integrated as a CodeBuild job in CodePipeline, making it part of the standardized deployment process.

### NEW QUESTION # 223

A company is planning a migration from an on-premises data center to the AWS cloud. The company plans to use multiple AWS accounts that are managed in an organization in AWS organizations. The company will cost a small number of accounts initially and will add accounts as needed. A solution architect must design a solution that turns on AWS accounts.

What is the MOST operationally efficient solution that meets these requirements.

- A. Create a new CloudTrail trail in all AWS accounts in the organization. Create new trails whenever a new account is created.
- B. Create an AWS systems Manager Automaton runbook that creates a cloud trail in all AWS accounts in the organization. Invoke the automation by using Systems Manager State Manager.
- C. Create a new CloudTrail trail in the organizations management account. Configure the trail to log all events for all AYYs accounts in the organization.
- D. Create an AWS Lambda function that creates a new cloudTrail trail in all AWS account in the organization. Invoke the Lambda function daily by using a scheduled action in Amazon EventBridge.

**Answer: C**

Explanation:

The most operationally efficient solution for turning on AWS CloudTrail across multiple AWS accounts managed within an AWS Organization is to create a single CloudTrail trail in the organization's management account and configure it to log events for all accounts within the organization. This approach leverages CloudTrail's ability to consolidate logs from all accounts in an organization, thereby simplifying management, reducing overhead, and ensuring consistent logging across accounts. This method eliminates the need for manual intervention in each account, making it an operationally efficient choice for organizations planning to scale their AWS usage.

Reference:

AWS CloudTrail Documentation: Provides detailed instructions on setting up CloudTrail, including how to configure it for an organization.

AWS Organizations Documentation: Offers insights into best practices for managing multiple AWS accounts and how services like CloudTrail integrate with AWS Organizations.

AWS Best Practices for Security and Governance: Guides on how to effectively use AWS services to maintain a secure and well-governed AWS environment, with a focus on centralized logging and monitoring.

### NEW QUESTION # 224

A SaaS web app runs on EC2 Linux behind an ALB. It stores user sessions in an RDS Multi-AZ database. During high traffic, the app suffers latency due to session read/write.

What is the best way to reduce session latency?

Options:

- A. Use FSx for Windows and mount it.
- B. Use Multi-Attach EBS volumes.
- C. Use ElastiCache for Redis to store sessions.
- D. Store session data in Amazon S3.

**Answer: C**

Explanation:

Dis the AWS best practice for session storage: Use ElastiCache for Redis- a fast, in-memory data store that handles high throughput with microsecond latency.

It's highly scalable, fault-tolerant, and optimized for temporary, fast-access session data.

Incorrect:

A: S3 is slow and object-based - not for session I/O.

B: FSx is Windows-only and not ideal for this use case.

C: EBS Multi-Attach has limitations, complexity, and is not suitable for high-performance shared memory.

### NEW QUESTION # 225

A company has implemented an ordering system using an event-driven architecture. During initial testing, the system stopped processing orders. Further log analysis revealed that one order message in an Amazon Simple Queue Service (Amazon SQS) standard queue was causing an error on the backend and blocking all subsequent order messages. The visibility timeout of the queue is set to 30 seconds, and the backend processing timeout is set to 10 seconds. A solutions architect needs to analyze faulty order messages and ensure that the system continues to process subsequent messages.

Which step should the solutions architect take to meet these requirements?

- A. Configure a new SQS standard queue as a dead-letter queue to isolate the faulty messages.
- B. Reduce the visibility timeout of the queue to automatically remove the faulty message.
- C. Configure a new SQS FIFO queue as a dead-letter queue to isolate the faulty messages.
- D. Increase the backend processing timeout to 30 seconds to match the visibility timeout.

**Answer: A**

Explanation:

The dead-letter queue of a FIFO queue must also be a FIFO queue. Similarly, the dead-letter queue of a standard queue must also be a standard queue.

<https://docs.aws.amazon.com/AWSSimpleQueueService/latest/SQSDeveloperGuide/sqs-dead-letter-queues.html>
