VMware vSphere 8.x Advanced Design Sample Questions (Q55-Q60):

NEW QUESTION # 55

A customer provides the following list of requirements for their vSphere platform:

- REQ01 The solution should utilize dual network connections to eliminate single points of failure.
- REQ02 The solution should allow logs to be retained for a period of 30 days.
- REQ03 All user access to the platform should be recorded for audit purposes.
- REQ04 The solution should allow the management of multiple ESXi hosts.
- REQ05 The solution should allow users to view the remote console of virtual machines.

Which two of the listed requirements would be classified as non-functional requirements? (Choose two.)

- A. The solution should allow users to view the remote console of virtual machines
- **B. The solution should utilize dual network connections to eliminate single points of failure**
- C. All user access to the platform should be recorded for audit purposes
- **D. The solution should allow logs to be retained for a period of 30 days**
- E. The solution should allow the management of multiple ESXi hosts

Answer: B,D

NEW QUESTION # 56

An architect is designing a new vSphere 8 environment and needs to plan the migration of virtual machines from the source vSphere 7 infrastructure.

The following has been captured about the source infrastructure and project:

All virtual machines operate supported versions of Microsoft Windows

All virtual machines have VMware Tools 11 or higher installed

vCenter Enhanced Linked Mode is configured

VMware PowerCLI is available in the environment

No budget is available for discovery tooling

The architect must capture and review active services from inside running virtual machines to inform the migration design.

Considering the information available, which method can the architect use to acquire the information required?

- A. Deploy and review the service information from VMware Aria Operations
- B. Request and review the information via VMware vCenter
- **C. Request and review the information via VMware Tools and VMware PowerCLI**

- D. Deploy and review the service information from VMware Aria Operations for Applications

Answer: C

Explanation:

Given that VMware Tools 11 or higher is installed on all virtual machines and VMware PowerCLI is available in the environment, the architect can leverage PowerCLI to interact with VMware Tools and collect information about active services running inside the virtual machines.

VMware PowerCLI allows you to query virtual machines for information about their services by accessing the guest operating system, provided VMware Tools is installed and running. You can use PowerCLI cmdlets to retrieve service data, such as which services are running on the VM, their statuses, and other details necessary for planning the migration.

This option is cost-effective since there is no budget available for additional discovery tooling, and it aligns well with the existing tools and infrastructure already in place.

NEW QUESTION # 57

An architect decides to separate virtual desktops and application servers into separate vSphere clusters to meet security and management requirements.

What are two implications of this design decision- (Choose two.)

- A. There will be a reduction in performance.
- **B. There will be an increase in management overhead.**
- C. Identical hardware must be procured for all hosts.
- D. The patching cycles will affect both clusters at the same time.
- **E. There will be additional licensing and cost requirements for both clusters.**

Answer: B,E

Explanation:

A: There will be an increase in management overhead. - multiple clusters to manage B; Identical hardware must be procured for all hosts. - separate clusters so hardware can be very different C: There will be a reduction in performance. - there would be a performance increase in segregation D: The patching cycles will affect both clusters at the same time. - this is not true.

E: There will be additional licensing and cost requirements for both clusters. - process of elimination leaves this

NEW QUESTION # 58

An architect is designing a new workload domain in an existing VMware Cloud Foundation environment. The customer requirement is to physically separate the vSAN network traffic from other management network flows.

Which design decision should the architect make to meet this requirement?

- A. Deploy the new workload domain using SDDC Manager.
- B. Deploy the new workload domain using a vSAN stretched cluster.
- **C. Deploy the new workload domain using multiple physical adapters.**
- D. Deploy the new workload domain using API.

Answer: C

Explanation:

To physically separate the vSAN network traffic from other management network flows, the architect should configure the workload domain with multiple physical adapters. This will ensure that the vSAN traffic (which uses specific network ports and protocols) is isolated from other management traffic. By using separate physical adapters, the network traffic for each type can be kept distinct, reducing the risk of congestion and ensuring that each traffic type has dedicated bandwidth.

NEW QUESTION # 59

An architect is conducting interviews to gather requirements for a new vSphere-based private cloud solution.

The following information has been provided by the customer:

The customer, after 10 years within an outsourced managed service contract, has decided to bring application hosting back in-house but lacks the VMware skills to support this.

The customer currently has 5,000 workloads under contract and managed by their partner.

The customer would like to keep IT infrastructure costs at a minimum.
