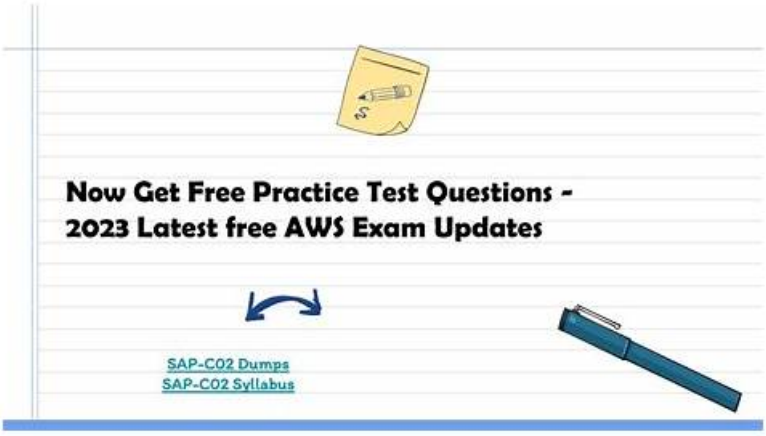
Latest SAP-C02 Exam Duration, Reliable SAP-C02 Test Practice



2026 Latest Dumpkiller SAP-C02 PDF Dumps and SAP-C02 Exam Engine Free Share: https://drive.google.com/open?id=1cOqX1WrjWglkfm2EkdKtmJ_VU0DdUpbr

By focusing on how to help you more effectively, we encourage exam candidates to buy our SAP-C02 study braindumps with high passing rate up to 98 to 100 percent all these years. Our experts designed three versions for you rather than simply congregate points of questions into SAP-C02 Real Questions. Efforts conducted in an effort to relieve you of any losses or stress. So our activities are not just about profitable transactions to occur but enable exam candidates win this exam with the least time and get the most useful contents.

The SAP-C02 certification is an excellent way for professionals to demonstrate their advanced skills and expertise in designing and deploying complex systems on AWS. It is highly valued by employers and recognized by AWS as a requirement for several advanced AWS partner programs. With the right preparation and training, candidates can successfully pass the SAP-C02 Exam and take their AWS skills and expertise to the next level.

Reliable SAP-C02 Test Practice, New SAP-C02 Exam Experience

This AWS Certified Solutions Architect - Professional (SAP-C02) (SAP-C02) practice exam software is easy to use. A free demo version of this format is also available to assess it before buying. It is compatible with all Windows computers. This Amazon SAP-C02 Practice Test software familiarizes you with the real AWS Certified Solutions Architect - Professional (SAP-C02) (SAP-C02) exam pattern. You must have an active Internet connection to validate your product license.

Amazon SAP-C02 exam is a professional-level certification designed for individuals who want to validate their advanced technical skills in designing and deploying scalable, highly available, and fault-tolerant systems on Amazon Web Services (AWS) platform. SAP-C02 exam measures an individual's ability to architect and deploy secure, robust, and reliable applications on AWS. The SAP-C02 Exam is designed for individuals who have already earned their AWS Certified Solutions Architect - Associate certification and have gained relevant work experience in designing and deploying AWS-based applications.

Amazon AWS Certified Solutions Architect - Professional (SAP-C02) Sample Questions (Q393-Q398):

NEW QUESTION # 393
A company wants to record key performance indicators (KPIs) from its application as part of a strategy to convert to a user-based licensing schema. The application is a multi-tier application with a web-based UI. The company saves all log files to Amazon CloudWatch by using the CloudWatch agent. All logins to the application are saved in a log file.
As part of the new license schema, the company needs to find out how many unique users each client has on a daily basis, weekly basis, and monthly basis.
Which solution will provide this information with the LEAST change to the application?

- A. Configure an Amazon CloudWatch Logs metric filter that saves each successful login as a metric. Configure the user name and client name as dimensions for the metric.
- B. Configure an AWS Lambda function to consume an Amazon CloudWatch Logs stream of the application logs. Additionally, configure the Lambda function to increment a custom metric in CloudWatch that uses the user name and client name as dimensions for the metric.
- C. Configure the CloudWatch agent to extract successful login metrics from the logs. Additionally, configure the CloudWatch agent to save the successful login metrics as a custom metric that uses the user name and client name as dimensions for the metric.
- D. Change the application logic to make each successful login generate a call to the AWS SDK to increment a custom metric that records user name and client name dimensions in CloudWatch.

Answer: A

Explanation:
https://docs.aws.amazon.com/AmazonCloudWatch/latest/logs/MonitoringPolicyExamples.html

NEW QUESTION # 394
A company wants to manage the costs associated with a group of 20 applications that are infrequently used, but are still business-critical, by migrating to AWS. The applications are a mix of Java and Node.js spread across different instance clusters. The company wants to minimize costs while standardizing by using a single deployment methodology.
Most of the applications are part of month-end processing routines with a small number of concurrent users, but they are occasionally run at other times Average application memory consumption is less than 1 GB.
though some applications use as much as 2.5 GB of memory during peak processing. The most important application in the group is a billing report written in Java that accesses multiple data sources and often runs for several hours.
Which is the MOST cost-effective solution?

- A. Deploy Amazon ECS containers on Amazon EC2 with Auto Scaling configured for memory utilization of 75%. Deploy an ECS task for each application being migrated with ECS task scaling. Monitor services and hosts by using Amazon CloudWatch.
- B. Deploy a separate AWS Lambda function tor each application. Use AWS CloudTrail logs and Amazon CloudWatch alarms to verify completion of critical jobs.
- C. Deploy a new Amazon EC2 instance cluster that co-hosts all applications by using EC2 Auto Scaling and Application Load Balancers. Scale cluster size based on a custom metric set on instance memory utilization. Purchase 3-year Reserved Instance reservations equal to the GroupMaxSize parameter of the Auto Scaling group.
- D. Deploy AWS Elastic Beanstalk for each application with Auto Scaling to ensure that all requests have sufficient resources. Monitor each AWS Elastic Beanstalk deployment by using CloudWatch alarms.

Answer: A

Explanation:
https://docs.aws.amazon.com/elasticbeanstalk/latest/dg/AWSHowTo.cloudwatch.html Elastic Beanstalk automatically uses Amazon CloudWatch to help you monitor your application and environment status. You can navigate to the Amazon CloudWatch console to see your dashboard and get an overview of all of your resources as well as your alarms. You can also choose to view more metrics or add custom metrics.

NEW QUESTION # 395
A solutions architect is building a web application that uses an Amazon RDS for PostgreSQL DB instance The DB instance is expected to receive many more reads than writes. The solutions architect needs to ensure that the large amount of read traffic can be accommodated and that the DB instance is highly available.
Which steps should the solutions architect take to meet these requirements? (Select THREE)

- A. Create an Application Load Balancer (ALB) and put the read replicas behind the ALB.
- B. Create multiple read replicas in different Availability Zones.
- C. Configure an Amazon Route 53 health check for each read replica using its endpoint
- D. Create multiple read replicas and put them into an Auto Scaling group.
- E. Configure an Amazon CloudWatch alarm to detect a failed read replic
  a. Set the alarm to directly invoke an AWS Lambda function to delete its Route 53 record set.
- F. Create an Amazon Route 53 hosted zone and a record set for each read replica with a TTL and a weighted routing policy.

Answer: B,C,F

Explanation:
https://aws.amazon.com/premiumsupport/knowledge-center/requests-rds-read-replicas/ You can use Amazon Route 53 weighted record sets to distribute requests across your read replicas. Within a Route 53 hosted zone, create individual record sets for each DNS endpoint associated with your read replicas and give them the same weight. Then, direct requests to the endpoint of the record set. You can incorporate Route 53 health checks to be sure that Route 53 directs traffic away from unavailable read replicas

NEW QUESTION # 396
A company has a new application that needs to run on five Amazon EC2 instances in a single AWS Region. The application requires high-throughput, low-latency network connections between all of the EC2 instances where the application will run. There is no requirement for the application to be fault tolerant.
Which solution will meet these requirements?

- A. Launch five new EC2 instances into an Auto Scaling group in the same Availability Zone. Attach an extra elastic network interface to each EC2 instance.
- B. Launch five new EC2 instances into a cluster placement group. Ensure that the EC2 instance type supports enhanced networking.
- C. Launch five new EC2 instances into a partition placement group. Ensure that the EC2 instance type supports enhanced networking.
- D. Launch five new EC2 instances into a spread placement group. Attach an extra elastic network interface to each EC2 instance.

Answer: B

NEW QUESTION # 397
A company runs a popular web application in an on-premises data center. The application receives four million views weekly. The company expects traffic to increase by 200% because of an advertisement that will be published soon.
The company needs to decrease the load on the origin before the increase of traffic occurs. The company does not have enough time to move the entire application to the AWS Cloud.
Which solution will meet these requirements?

- A. Create an Amazon CloudFront content delivery network (CDN) that uses a Real Time Messaging Protocol (RTMP) distribution. Enable query forwarding to the origin. Use an on-premises load balancer as the origin. Offload the DNS querying to AWS to handle CloudFront CDN traffic.
- B. Create an accelerator in AWS Global Accelerator. Add listeners for HTTP and HTTPS TCP ports.
  Create an endpoint group. Create a Network Load Balancer (NLB), and attach it to the endpoint group.
  Point the NLB to the on-premises servers. Offload the DNS querying to AWS to handle AWS Global Accelerator traffic.
- C. Create an Amazon CloudFront content delivery network (CDN). Enable query forwarding to the origin.
  Create a managed cache policy that includes query strings. Use an on-premises load balancer as the origin. Offload the DNS querying to AWS to handle CloudFront CDN traffic.
- D. Create an accelerator in AWS Global Accelerator. Add listeners for HTTP and HTTPS TCP ports.Create an endpoint group. Create an Application Load Balancer (ALB), and attach it to the endpoint group. Point the ALB to the on-premises servers. Offload the DNS querying to AWS to handle AWS Global Accelerator traffic.

Answer: D
