Exam ACD201 Topic, ACD201 New Braindumps

The Appian ACD201 practice exam software of TrainingQuiz has questions that have a striking resemblance to the queries of the Appian Senior Developer (ACD201) real questions. It has a user-friendly interface. You don't require an active internet connection to run it once the ACD201 Practice Test software is installed on Windows computers and laptops.

Appian Senior Developer Sample Questions (Q30-Q35):

NEW QUESTION # 30

You need to create a quality control (QC) review process for a factory that allows a QC technician to review each production line regularly.

You have the following requirements:

- * Each technician has 45 minutes to complete their review.
- * After 45 minutes, the review will expire.
- * Expired reviews are flagged as 'Review expired.'
- * 'Review expired' flags trigger an email notification to a supervisor, and the review data should not be saved.
- * The technician can save a Draft copy of their review before submission and can come back to work on it later if necessary.
- * Once a review is 'Submitted,' the review data is saved to the database What should you implement?

- A. A send message event which sends an email after 45 minutes to the supervisor
- B. An exception timer that skips the OC review task after 45 minutes, which flows to a Send Email node configured to notify a supervisor.
- C. An escalation that sends an email after 45 minutes to the supervisor

Answer: B

NEW QUESTION # 31

You have designed a three-step 'Wizard' form interaction using user input tasks in the process model. The second step of the Wizard must utilize another process model which contains a user input task inside.

Which two methods should be implemented for a seamless Wizard-like interaction for the user? (Choose two.)

- A. Enable activity-chaining between all nodes on the main process model.
- B. Use a subprocess to call the second process model.
- C. Enable activity chaining between all nodes in the second process model, and activity chain between all user input tasks.
- D. Use the Start Process smart service to call the second process model.

Answer: A,B

Explanation:

Enabling activity-chaining between all nodes on the main process model ensures the wizard steps flow seamlessly for the user.

Using a subprocess to call the second process model allows the main process to incorporate its user input task as part of the wizard flow with activity-chaining support.

NEW QUESTION # 32

The synced record Task has a self-referential relationship defined in the column parentTaskId. There is a many-to-one record relationship between the id and parentTaskId called parentTask.

For a given task ID, you need to return the task name and the parent task name.

What should you do?

- A. Use a!queryRecordType() filtered on the task id once to return the task name and parent task ID. Query the record again to return the parent task name.
- B. Create a sync-time custom record field on the Task record called parentName. Specify this field to return in the query field selection.
- C. Use a!queryRecordType() with a filter on the task id, with fields specified to return recordType!Task.name and recordType!Task.parentTask.name.

Answer: C

Explanation:

Using a!queryRecordType() with a filter on the task ID and specifying both recordType!Task.name and recordType!Task.parentTask.name in the fields will efficiently return both the task name and its parent task name in a single query.

NEW QUESTION # 33

You're conducting a design review.

You identify slow-performing expression rules querying a specific data store, and need to understand the "number of operations against data stores."

Which metric from the data_store_details.csv file is helpful to you?

- A. TCCCotal Count
- B. Execute Count
- C. Query Count

Answer: C

Explanation:

The "Query Count" metric in the data_store_details.csv file indicates the number of operations (queries) performed against data stores, helping you analyze data store usage.

NEW QUESTION # 34

An insurance company's product details are currently distributed across numerous database tables, encompassing over 60 to 70 fields.

You need to implement a product comparison tool for business users to compare up to three insurance products simultaneously, with all the product details in a tabular format.

Refer to the following sample format:

Which object should be used to transform the data into the required format?

- A. Stored procedure
- B. Record type with relationships
- C. VCCCiews

Answer: C

Explanation:

Database views are ideal for transforming complex, distributed product data into a single, flattened structure tailored for reporting or comparison. In this case, a view can pivot the 60-70 fields and organize them by attribute (e.g., Name, Type, Premium) across multiple product columns, enabling a tabular comparison layout like the one shown. Views also optimize performance and reduce transformation overhead in the interface layer.

NEW QUESTION # 35

.....

Everyone wants to have a good job and decent income. But if they don't have excellent abilities and good major knowledge they are
