

Analytics-Arch-201 Guide Torrent: Salesforce Certified Tableau Architect & Analytics-Arch-201 Test Braindumps Files

P.S. Free & New Analytics-Arch-201 dumps are available on Google Drive shared by PassExamDumps:
<https://drive.google.com/open?id=1cStXnOQQMJkDZkvjnBEEy8UDze8LFPsy>

To help you pass Analytics-Arch-201 exam is recognition of our best efforts. In order to achieve this goal, we constantly improve our Analytics-Arch-201 exam materials, allowing you to rest assured to use our dumps. If you have any question about our products and services, you can contact our online support in our PassExamDumps website, and you can also contact us by email after your purchase. If there is any update of Analytics-Arch-201 software, we will notify you by mail.

Salesforce Analytics-Arch-201 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> • Monitor and Maintain a Tableau Deployment: This section evaluates skills of Tableau Administrators in monitoring, maintaining, and optimizing Tableau environments. It involves creating custom administrative dashboards, conducting load testing using tools like TabJolt, and analyzing test results. Troubleshooting complex performance bottlenecks in workbooks and server resources is key, as is tuning caching and scaling strategies. It covers leveraging observability tools such as the Resource Monitoring Tool, analyzing logs and metrics, and adjusting architecture accordingly. Automation of maintenance functions using APIs, scripting, and scheduling is included, along with managing server extensions, content automation, dashboard extensions, web data connectors, and secure embedded solutions.
Topic 2	<ul style="list-style-type: none"> • Deploy Tableau Server: This domain assesses the ability of Tableau Administrators to perform production-ready deployments of Tableau Server. It encompasses installing and configuring Tableau Server with external components, supporting air-gapped environments, disaster recovery validations, and blue-green deployments. It includes configuring and troubleshooting various authentication methods such as SAML, Kerberos, and LDAP. The section also covers implementing encryption strategies, installing and verifying Tableau Server on Linux and Windows platforms, resolving installation and configuration issues, and managing service accounts and logging.
Topic 3	<ul style="list-style-type: none"> • Design a Tableau Infrastructure: This section of the exam measures skills of Tableau Consultants and focuses on planning and designing a complex Tableau deployment. It covers gathering user requirements, licensing strategies including Authorization-to-Run, high availability and disaster recovery planning, and mapping server add-ons to the organization's needs. It includes planning and implementing Tableau Cloud with Bridge, authentication, user provisioning, and multi-site configuration. Additionally, it addresses migration planning across Tableau products, operating systems, identity stores, and consolidations, as well as designing process topologies, sizing, node roles, and recommending server configurations including security, hardware, and disaster recovery.

Newest Analytics-Arch-201 Test Torrent - How to Download for Analytics-Arch-201 Passguide Free of Charge

It is well known that the best way to improve your competitive advantages in this modern world is to increase your soft power, such as graduation from a first-tier university, fruitful experience in a well-known international company, or even possession of some globally recognized Analytics-Arch-201 certifications, which can totally help you highlight your resume and get a promotion in your workplace to a large extent. As a result, our Analytics-Arch-201 Study Materials raise in response to the proper time and conditions while an increasing number of people are desperate to achieve success and become the elite.

Salesforce Certified Tableau Architect Sample Questions (Q197-Q202):

NEW QUESTION # 197

When configuring trusted authentication for Tableau Server, which step is essential to ensure that the server securely accepts requests from a trusted third-party application?

- A. Setting up a VPN tunnel between Tableau Server and the third-party application
- B. Enabling cross-origin resource sharing (CORS) on Tableau Server for all domains
- C. Configuring all users in Tableau Server to have default administrative privileges
- D. Adding the third-party application's server IP address to the list of trusted hosts in Tableau Server

Answer: D

Explanation:

Adding the third-party application's server IP address to the list of trusted hosts in Tableau Server For trusted authentication to function correctly, it is crucial to add the third-party application's server IP address to Tableau Server's list of trusted hosts. This step ensures that Tableau Server recognizes and accepts authentication requests from this specific application, enhancing security by limiting access to known, trusted sources. Option A is incorrect because setting up a VPN tunnel is not a standard requirement for configuring trusted authentication in Tableau Server. Option C is incorrect as configuring default administrative privileges for all users is unrelated to trusted authentication and poses a security risk. Option D is incorrect because enabling CORS for all domains is not directly related to the configuration of trusted authentication and could introduce security vulnerabilities.

NEW QUESTION # 198

A rapidly expanding retail company is planning to deploy Tableau for its nationwide operations. What is the most important factor to consider for ensuring the scalability of the Tableau deployment?

- A. Limiting the number of users to control system load
- B. Using a single server regardless of increasing data and user requirements
- C. Focusing only on current data requirements without considering future growth
- D. Choosing a deployment model that can scale with increasing data volume and user count

Answer: D

Explanation:

Choosing a deployment model that can scale with increasing data volume and user count This option ensures that as the company grows, the Tableau deployment can accommodate increasing data volumes and a higher number of users, which is crucial for a rapidly expanding business. Option A is incorrect because limiting the number of users can hinder operational efficiency and business growth. Option B is incorrect as it fails to consider future growth, which is essential for a scalable and future-proof deployment. Option D is incorrect because relying on a single server for an expanding operation can lead to performance issues and does not support scalability.

NEW QUESTION # 199

When optimizing caching for Tableau Server to improve dashboard performance, which setting is most effective to adjust?

- A. Configuring the cache to be cleared at a regular, scheduled interval that aligns with the data refresh schedule
- B. Disabling caching entirely to force real-time queries for all dashboard views

- C. Setting the cache to refresh every time a view is loaded to ensure the most up-to-date data is always used
- D. Increasing the server's RAM to enhance its overall caching capability

Answer: A

Explanation:

Configuring the cache to be cleared at a regular, scheduled interval that aligns with the data refresh schedule Configuring Tableau Server's cache to clear at regular intervals that align with the data refresh schedule can effectively balance performance with data freshness. This approach ensures that users receive relatively recent data while still benefiting from the performance improvements that caching provides. Option A is incorrect because refreshing the cache every time a view is loaded can negate the performance benefits of caching and may lead to unnecessary load on the server. Option C is incorrect as disabling caching entirely would prevent Tableau Server from leveraging cached data for faster performance. Option D is incorrect because while increasing RAM can enhance a server's capacity, it does not directly optimize caching strategies related to dashboard performance.

NEW QUESTION # 200

In the context of SSL encryption for Tableau Server, what is an important consideration when renewing an SSL certificate?

- A. Temporarily disabling SSL encryption while waiting for the new certificate to be issued
- B. Switching to a different SSL protocol version during renewal for enhanced security
- C. Renewing the certificate with the exact same specifications as the old one to avoid configuration changes
- D. Ensuring that the new SSL certificate is renewed and installed before the expiration of the current certificate

Answer: D

Explanation:

Ensuring that the new SSL certificate is renewed and installed before the expiration of the current certificate When renewing an SSL certificate for Tableau Server, it is important to ensure that the new certificate is renewed and installed before the current one expires. This continuity prevents any interruptions in SSL encryption and maintains secure communications without any downtime or security warnings due to an expired certificate. Option A is incorrect because the new certificate does not necessarily need to have the exact same specifications; updates or changes might be beneficial. Option C is incorrect as switching SSL protocol versions during renewal should be done based on security needs and compatibility, not as a routine process. Option D is incorrect because disabling SSL encryption, even temporarily, can expose the server to security risks.

NEW QUESTION # 201

For a large organization using Tableau Server, what should be included in an automated complex disaster recovery plan to ensure rapid recovery of services?

- A. Utilizing only RAID configurations for data storage to prevent data loss
- B. A single annual full backup of the Tableau Server, complemented by periodic manual checks
- C. Frequent, automated backups of Tableau Server data, configuration, and content, stored in an off-site location
- D. Continuous, real-time backups of all user interactions and changes on the Tableau Server

Answer: C

Explanation:

Frequent, automated backups of Tableau Server data, configuration, and content, stored in an off-site location An effective component of an automated complex disaster recovery plan for a large organization's Tableau Server is the implementation of frequent, automated backups. These backups should include all critical data, configuration settings, and content, and they should be stored in an off-site location to protect against site-specific disasters. This approach ensures data integrity and enables rapid recovery of services in the event of a disaster. Option B is incorrect because a single annual backup is insufficient for a comprehensive disaster recovery strategy and does not account for frequent data changes. Option C is incorrect as continuous, real-time backups of all user interactions are generally not feasible and may be excessive for disaster recovery needs. Option D is incorrect because relying solely on RAID configurations, while useful for data redundancy, does not constitute a complete disaster recovery solution. RAID does not replace the need for regular off-site backups.
