New AP-202 Valid Practice Materials | Professional Valid AP-202 Exam Online: B2B Commerce for Developers Accredited Professional 100% Pass

Comparing to the training institution, our website can ensure you pass the Salesforce actual test with less time and money. You just need to use spare time to practice the AP-202 exam questions and remember key points of test answers. If you get a bad result in the AP-202 Practice Test, we will full refund you to reduce the loss of your money.

Salesforce B2B Commerce for Developers Accredited Professional Sample Questions (Q107-Q112):

NEW QUESTION # 107

A developer suspects recent edits to a checkout flow have created a bug based on flow errors being emailed. Given the emails and some inputs known to trigger the issue, which two activities should the developer consider in their investigation?

- A. Open the Flow and select Attach to Live Session, Provide the Session Id, Select Attach
- **B. Open the Flow, Select Debug, Provide the Inputs, Select Run**
- **C. Look at the previous flow versions and compare them with the current one**
- D. Use the Org Browser tool in the IDE to download the flow XML and run a diff report

Answer: B,C

Explanation:

To investigate a suspected bug in a checkout flow, comparing previous versions of the flow with the current one can help identify changes that might have introduced the bug. Additionally, Salesforce provides debugging capabilities within the Flow Builder, where a developer can select the debug option, provide input values known to trigger the issue, and execute the flow to observe its behavior, aiding in pinpointing the source of the problem.

NEW QUESTION # 108

A developer is on a tight timeline and needs to implement a Lightning web component which can read, create and modify single records. What is the recommended path forward?

- **A. Use Lightning Data Service**
- B. Use base components
- C. Create an Apex Controller
- D. Write custom functions against a wire adapter

Answer: A

Explanation:

To implement a Lightning web component which can read, create and modify single records, the recommended path forward is to use Lightning Data Service. Lightning Data Service is a service that provides access to Salesforce data and metadata, cache management, and data synchronization across components. Lightning Data Service allows developers to use standard components or base components to perform CRUD (create, read, update, delete) operations on single records without writing Apex code or SOQL queries. Lightning Data Service also handles data caching, performance optimization, and conflict resolution automatically. Using base components is not a sufficient way to implement a Lightning web component which can read, create and modify single records, as base components are only user interface elements that do not provide data access or manipulation functionality by themselves. Base components need to be used with Lightning Data Service or other services to perform CRUD operations on single records. Writing custom functions against a wire adapter is not a recommended way to implement a Lightning web component which can read, create and modify single records, as it involves writing complex and error-prone JavaScript code that may not be efficient or scalable. Writing custom functions against a wire adapter also requires handling data caching, performance optimization, and conflict resolution manually. Creating an Apex controller is not a recommended way either, as it involves writing Apex code that may not be necessary or optimal for performing CRUD operations on single records. Creating an Apex controller also requires exposing Apex methods using `@AuraEnabled` or `@RemoteAction` annotations and invoking them from JavaScript code using imperative calls or promises. NEW QUESTION # 109

The sizing keys used in the Salesforce B2B Commerce Global APIs five distinct operations. What are three of these operations? (3 answers)

- **A. Related Query to call (sub queries or direct queries)**

- **B. Object type casting**
- C. Return formats as Map<String, Object> or SObjects lists
- D. Override static DAO classes and methods
- **E. Refetch data (used on some Logic classes)**

Answer: A,B,E

Explanation:

The sizing keys used in the Salesforce B2B Commerce Global APIs perform five distinct operations. Three of these operations are: Refetch data (used on some Logic classes): This operation indicates that the data should be refetched from the database instead of using the cached data. For example, `ccrz.ccServiceCart.getCart(ccrz.ccAPI.SZ_REFETCH)` will refetch the cart data and refresh the cache.

Related Query to call (sub queries or direct queries): This operation indicates that the related entities should be retrieved by using sub queries or direct queries. For example, `ccrz.ccServiceProduct.getProducts(ccrz.ccAPI.SZ_SUBQUERY)` will use sub queries to fetch the related entities for each product, while `ccrz.ccServiceProduct.getProducts(ccrz.ccAPI.SZ_DIRECTQUERY)` will use direct queries to fetch the related entities separately.

Object type casting: This operation indicates that the data should be cast to a specific object type. For example, `ccrz.ccServiceProduct.getProducts(ccrz.ccAPI.SZ_SUBJECT)` will cast the data to sObjects instead of transformed objects. NEW QUESTION # 110

Which tool should a developer use to author automated tests for custom Lightning web components?

- A. Salesforce CLI
- **B. Jest**
- C. Salesforce Developer Console
- D. Visual Studio Code

Answer: B

Explanation:

A developer should use Jest to author automated tests for custom Lightning web components. Jest is a powerful tool with rich features for writing JavaScript tests. It is the recommended testing framework for Lightning web components by Salesforce¹. Jest allows the developer to write unit tests in local JavaScript files, run them from the command line or Visual Studio Code, and debug them using breakpoints and watch expressions². Jest also provides features such as mocking, code coverage, snapshots, and asynchronous testing³.

Option A, Option B, and Option D are incorrect because they are not testing tools, but rather development tools. Visual Studio Code is an integrated development environment (IDE) that supports Lightning web components development with extensions and plugins⁴. Salesforce CLI is a command line interface that allows the developer to create, deploy, and manage Lightning web components projects⁵. Salesforce Developer Console is a web-based tool that provides code editing, debugging, and testing features for Apex and Visualforce, but not for Lightning web components. Reference:

NEW QUESTION # 111

Which three data types are supported for custom fields while using CSV file format for importing data for a store?

- A. Address
- **B. Currency**
- **C. Lookup Relationship**
- **D. Text Area(Long)**
- E. Picklist (Multi-Select)

Answer: B,C,D

Explanation:

Three data types that are supported for custom fields while using CSV file format for importing data for a store are Text Area(Long), Lookup Relationship, and Currency. A custom field is a field that is added by a developer or an administrator to an object to store additional information or data. A data type is a property that defines the type, format, and validation rules of a field. A CSV file is a file format that stores tabular data in plain text using commas to separate values. A store is a record that represents a B2B or B2C storefront in Salesforce. Text Area(Long) is a data type that allows users to enter up to 131,072 characters on separate lines. Text Area(Long) is supported for custom fields while using CSV file format for importing data for a store. Lookup Relationship is a data type that allows users to create a relationship between two objects and select a value from another record. Lookup Relationship is supported for custom fields while using CSV file format for importing data for a store. Currency is a data type that allows users to enter currency values and automatically convert them based on the user's locale and currency settings. Currency is supported for custom fields while using CSV file format for importing data for a store. Picklist (Multi-Select) is a data type that allows users to select one or more values from a predefined list of values. Picklist (Multi-Select) is not supported for custom fields while using CSV file format for importing data for a store. Address is a data type that allows users to enter address values and automatically format them based on the user's locale settings. Address is not supported for custom fields while using CSV file format for importing data for a store.
