## SAP Certified Associate - Validating Business Transformation Sample Questions (Q27-Q32):

### NEW QUESTION # 27

Which approach combines the Greenfield and Brownfield strategies?

- A. Cloud-Native Apps
- **B. Selective Data Transition**
- C. Side-by-Side Migration
- D. Hybrid Cloud

**Answer: B**

Explanation:

Selective Data Transition (SDT) is a specialized approach that blends elements of both Greenfield (new implementation) and Brownfield (system conversion) strategies. This hybrid methodology allows organizations to selectively migrate configuration settings, historical data, and business processes from their existing systems into a new SAP S/4HANA environment. Unlike a pure Greenfield approach, which requires starting completely fresh, SDT preserves valuable components of the legacy system. At the same time, it avoids the full conversion requirements of a Brownfield approach, offering greater flexibility for reengineering processes and adopting SAP best practices.

SDT is especially useful for companies with multiple ERP systems or those undergoing large-scale consolidation. It enables harmonization of processes, data cleansing activities, and the adoption of standardized templates while still leveraging existing investment where beneficial.

The other options do not combine the two approaches. Cloud-native apps refer to development style; side-by-side migration describes extension patterns; hybrid cloud refers to infrastructure strategy. Selective Data Transition is the only transformation methodology that formally merges the strengths of both Greenfield and Brownfield.

**Answer: A**

Explanation:

Application Portfolio Management (APM) is the LeanIX product specifically designed to help organizations analyze their current application landscape. APM allows companies to evaluate redundancy, risks, and optimization opportunities. Other LeanIX modules support planning or governance but do not focus primarily on understanding the existing application portfolio.

Integration & Exception Monitoring in SAP Cloud ALM provides transparency into message flows and data exchanges between integrated systems. This helps operations teams quickly identify root causes and ensure uninterrupted business processes. It does not track master data roles or cross-system process conformance; its focus is strictly on integration health and exception handling.
