all records	must be kept on site for 3 years
planned removal from service	When the system or portion of standpipe system is placed out of service for inspection, testing, maintenance, etc. , no more than one floor can be out of service and notification must be made to impairment coordinator
Unplanned out of service condition:	A serious defect in the standpipe or sprinkler system including, but not limited to: an empty tank, a break or major leak in the system's water piping, inoperative or shut water supply valves, defective fire department connections, construction related shut downs affecting more than one floor, or complete or partial shut downs of the standpipe system, other than a shut down for a planned removal from service.
notification for planned removal from service	no notification to the fire department is required provided the system will fully return to service within 8 hours
notification for unplanned removal from service	reporting to owner of building and to FDNY BOROUGH DISPATCHER
red tag on standpipe	system full out of service or partially

Now it is a society of abundant capable people, and there are still a lot of industry is lack of talent, such as the IT industry is quite lack of technical talents. IBM certification C1000-189 exam is one of testing IT technology certification exams. TrainingDump is a website which provide you a training about IBM Certification C1000-189 Exam related technical knowledge.

IBM C1000-189 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Integration: This section of the exam measures the skills of Integration Engineers and assesses their proficiency in connecting Instana with external monitoring and automation tools. Candidates must demonstrate knowledge of integrating agent-based systems such as Omegamon, ITM, and ITCAM, as well as external platforms like Prometheus and Grafana. The section also includes configuring alert channels, automation actions, and utilizing the Instana REST API to support customized workflows and data visibility.

Topic 2	<ul style="list-style-type: none"> • Planning: This section of the exam measures the skills of Cloud Monitoring Engineers and covers the foundational planning tasks required for successful Instana deployment. Candidates must understand the installation prerequisites, the architectural design of Instana for on-premises environments, and the platform core capabilities and use cases. It also assesses knowledge of different agent modes, supported sensors and tracers, and the distinctions between cloud service agents and serverless agents essential for scalable implementation.
Topic 3	<ul style="list-style-type: none"> • Installation: This section of the exam measures the skills of System Implementation Specialists and focuses on installing and deploying Instana across different environments. It includes installing the Instana backend, deploying and configuring agents, and migrating existing Instana setups. Candidates will also demonstrate their ability to implement Synthetic Monitoring and manage Points of Presence (PoPs) effectively for end-to-end performance validation.
Topic 4	<ul style="list-style-type: none"> • Troubleshooting: This section of the exam measures the skills of System Support Engineers and focuses on resolving technical and operational issues in Instana. It includes configuring log levels, collecting logs for debugging, and identifying connectivity issues between agents and the backend. Candidates will troubleshoot installation failures, diagnose communication problems, and apply corrective measures to ensure consistent Instana performance and stability across environments.

Free PDF Quiz 2026 Professional IBM Accurate C1000-189 Study Material

The product is made in three different formats to help customers with different preparation styles meet their needs. One of these formats is IBM C1000-189 Dumps PDF file which is printable and portable. Users can take IBM Instana Observability v1.0.277 Administrator - Professional (C1000-189) PDF questions anywhere and use them anytime.

IBM Instana Observability v1.0.277 Administrator - Professional Sample Questions (Q61-Q66):

NEW QUESTION # 61

Which SDK can be used for Instana HTTP tracing?

- **A. Trace Web**
- B. Configure Web
- C. Haskell
- D. Programmatic Web

Answer: A

Explanation:

IBM explicitly identifies Trace Web SDK as the framework component for implementing HTTP tracing within Instana's observability ecosystem. The latest content in the IBM Instana documentation (v1.0.307, aligning to v1.0.277 functionally) notes: "You can use the Trace Web SDK to instrument HTTP services and APIs for distributed tracing in Instana." This SDK provides ready-made APIs that attach trace context to inbound and outbound web requests, ensuring coherent transaction tracking across services. It supports both automatic instrumentation (for frameworks like Express.js, Django via agents) and manual control where developers call startTrace and finishTrace operations as shown in examples. Unlike Programmatic Web or Configure Web identified in older third-party sources, Trace Web is the modern, supported mechanism per IBM's official guidance. Haskell is unsupported as an SDK target. Consequently, selection of C (Trace Web) aligns with verified official IBM designations.

NEW QUESTION # 62

Which action triggers an event when a Synthetic PoP is uninstalled?

- A. Manually trigger the "Synthetic pop status" event after PoP uninstallation.
- B. Create a customized event using the Offline event detection system rule.
- **C. Rely on the "Synthetic pop status" built-in event, which automatically triggers when a PoP is uninstalled.**

- D. Modify the default settings of the "Synthetic pop status" event to detect uninstallation.

Answer: C

Explanation:

IBM Instana documentation describes automated event management for Synthetic Points of Presence (PoP). When a Synthetic PoP is uninstalled or goes offline, Instana's event model will automatically trigger the "Synthetic pop status" event. The verified statement found in the latest docs: "The 'Synthetic pop status' built-in event automatically triggers when a Synthetic PoP is uninstalled or taken offline, notifying administrators for actionable response." No manual intervention or custom rule creation is needed (A, B), and default event logic already covers all offline or removal states so configuration changes (D) aren't necessary. This ensures real-time visibility for operational teams to maintain synthetic coverage, immediately alerting when synthetic endpoint monitoring is compromised or reconfigured. Built-in event automation is an Instana best practice, limiting operational complexity and maintaining compliance.

NEW QUESTION # 63

What is a valid method for an administrator to delete the 2FA settings of a user?

- A. Use the kubectlnstana command line utility which provides the reset-2fa command.
- **B. Go to settings -> Users, select the user, and delete the 2FA settings there.**
- C. SSH into the Clickhouse database pod, use SQL to delete the 2FA entry from the user.
- D. Submit a delete request to the API with the user's email.

Answer: B

Explanation:

Per IBM Instana's security documentation, management of two-factor authentication (2FA) is controlled directly via administrative functions in the web UI. The guidance reads: "Administrators can remove a user's 2FA association by navigating to Settings > Users, choosing the user, and using the remove or reset 2FA option in the UI." This workflow is safe, auditable, and leaves a traceable event in the audit log, satisfying enterprise security policy requirements. Direct API or CLI deletion of 2FA is not the recommended (or documented) method for Instana-managed users, and database-level manipulation (D) is unsupported as it risks data corruption. The UI approach is verified for both on-premises and SaaS installations.

NEW QUESTION # 64

What is mandatory to use Instana REST APIs?

- A. CURL
- B. Python
- C. Cookie
- **D. Token**

Answer: D

Explanation:

Access to Instana's REST API is secured using authorization tokens—an industry-standard best practice for API authentication and traceability. IBM documentation says: "A personal or team API token is required to authenticate REST API calls." Tokens serve as credentials embedded in HTTP headers on each request, providing both identity and access control for the API consumer. Tokens are mandatory; without a valid token, any API requests are denied with a 401 Unauthorized error, regardless of whether a tool (such as CURL) is used. Tokens can be scoped for individual users (personal tokens) or teams (team tokens), enabling granular tracking and revocation as part of enterprise security policies. API tokens are generated from the Instana UI under the profile or team section. Cookies and raw client libraries (e.g., Python) are not authentication methods for Instana APIs.

NEW QUESTION # 65

How can an administrator collect initial troubleshooting information in self-hosted Standard Edition?

- A. stanctl trace
- B. stanctl collect
- **C. stanctl must-gather**
- D. stanctl debug

Answer: C

Explanation:

Administrators managing self-hosted Standard Edition clusters can generate diagnostic bundles using the verified IBM command `stanctl must-gather`. The documentation specifies: "The 'stanctl must-gather' command collects logs, configuration files, and relevant diagnostic output from all components for analysis and support submission." This standardized data-collection utility aggregates information across microservices and stores it into an archive for troubleshooting. Other commands (`trace`, `debug`, `collect`) serve specific functions but do not generate the comprehensive support package expected by IBM Support. `Must-gather` ensures inclusion of system status, resource snapshots, and error contexts, effectively accelerating issue resolution. This feature parallels other IBM products' `must-gather` standards, ensuring consistent methodology for customer support cases and automated diagnostics workflow.

NEW QUESTION # 66
