To be successful in a professional exam like the Google Professional-Cloud-Database-Engineer exam, you must know the criteria to pass it. You should know the type of Google Cloud Certified - Professional Cloud Database Engineer questions, the pattern of the Google Cloud Certified - Professional Cloud Database Engineer exam, and the time limit to complete the Professional-Cloud-Database-Engineer Exam. All these factors help you pass the Google Professional-Cloud-Database-Engineer exam. TrainingDump is your reliable partner in getting your Professional-Cloud-Database-Engineer certification. The Google Professional-Cloud-Database-Engineer exam dumps help you achieve your professional goals.

Google Professional-Cloud-Database-Engineer certification exam is designed to test the knowledge and skills of individuals in the field of cloud database engineering. Google Cloud Certified - Professional Cloud Database Engineer certification is aimed at professionals who have experience in designing, developing, and managing cloud-based database solutions using Google Cloud Platform technologies. Professional-Cloud-Database-Engineer exam focuses on a range of topics, including database architecture, data modeling, database security, and database migration.

To be eligible for the Google Professional-Cloud-Database-Engineer Certification Exam, you must have at least three years of experience in managing databases on a cloud platform, including one year of experience in designing and implementing databases on Google Cloud. You should also have a good understanding of database concepts and technologies, such as SQL, NoSQL, and

database management systems. Additionally, you should have hands-on experience with Google Cloud Platform services related to databases, such as Cloud SQL, Cloud Spanner, and Cloud Bigtable.

Now in this time so precious society, I suggest you to choose TrainingDump which will provide you with a short-term effective training, and then you can spend a small amount of time and money to pass your first time attend Google Certification Professional-Cloud-Database-Engineer Exam.

Google Professional-Cloud-Database-Engineer Certification Exam is a valuable credential for database professionals who want to demonstrate their expertise in managing cloud-native database solutions on the Google Cloud Platform. Professional-Cloud-Database-Engineer exam is challenging, but passing it signifies that the candidate has a deep understanding of Google Cloud Platform's database services and can design, develop, and manage cloud-native database solutions with confidence.

Google Cloud Certified - Professional Cloud Database Engineer Sample Questions (Q50-Q55):

NEW QUESTION # 50

You are deploying a Cloud SQL for MySQL database to serve a non-critical application. The database size is 10 GB and will be updated every night with data stored in a Cloud Storage bucket. The database serves read-only traffic from the application during the day. The data locality requirement of this application mandates that data must reside in a single region. You want to minimize the cost of running this database while maintaining an RTO of 1 day. What should you do?

- A. Create a Cloud SQL for MySQL instance with high availability (HA) enabled. Configure automated backups of the Cloud SQL instance and use the default backup location.
- B. Create a Cloud SQL for MySQL instance with high availability (HA) disabled. Create a read replica in the same zone.
- C. Create a Cloud SQL for MySQL instance with high availability (HA) disabled. Configure automated backups of the Cloud SQL instance and use a custom backup location to store backups in a Cloud Storage bucket in the same region.
- D. Create a Cloud SQL for MySQL instance with high availability (HA) disabled. Create a read replica in a second region.

Answer: C

NEW QUESTION # 51

You are troubleshooting a connection issue with a newly deployed Cloud SQL instance on Google Cloud. While investigating the Cloud SQL Proxy logs, you see the message Error 403: Access Not Configured. What should you do?

- A. Check whether your service account has cloudsql.instances.connect permission.
- B. Check the app.yaml value cloud_sql_instances for a misspelled or incorrect instance connection name.
- C. Enable the Cloud SQL Admin API.
- D. Ensure that you are using an external (public) IP address interface.

Answer: C

Explanation:

<https://cloud.google.com/sql/docs/mysql/connect-auth-proxy#troubleshooting> C because in docs it says "Make sure to enable the Cloud SQL Admin API. If it is not, you see output like Error 403: Access Not Configured in your Cloud SQL

NEW QUESTION # 52

You want to migrate an on-premises 100 TB Microsoft SQL Server database to Google Cloud over a 1 Gbps network link. You have 48 hours allowed downtime to migrate this database. What should you do? (Choose two.)

- A. Use a change data capture (CDC) migration strategy.
- B. Increase the network bandwidth to 2 Gbps, and then perform an offline data migration.

- C. Keep the network bandwidth at 1 Gbps, and then perform an offline data migration.
- D. Increase the network bandwidth to 10 Gbps, and then perform an offline data migration.
- E. Move the physical database servers from on-premises to Google Cloud.

Answer: A,D

Explanation:

https://cloud.google.com/architecture/migration-to-google-cloud-transferring-your-large-datasets#online_versus_offline_transfer

NEW QUESTION # 53

You are the DBA of an online tutoring application that runs on a Cloud SQL for PostgreSQL database. You are testing the implementation of the cross-regional failover configuration. The database in region R1 fails over successfully to region R2, and the database becomes available for the application to process data. During testing, certain scenarios of the application work as expected in region R2, but a few scenarios fail with database errors. The application-related database queries, when executed in isolation from Cloud SQL for PostgreSQL in region R2, work as expected. The application performs completely as expected when the database fails back to region R1. You need to identify the cause of the database errors in region R2. What should you do?

- A. Determine whether the database patches of Cloud SQL for PostgreSQL in regions R1 and R2 are different.
- B. Determine whether the failover of Cloud SQL for PostgreSQL from region R1 to region R2 is in progress or has completed successfully.
- C. Determine whether Cloud SQL for PostgreSQL in region R2 is a near-real-time copy of region R1 but not an exact copy.
- D. Determine whether the versions of Cloud SQL for PostgreSQL in regions R1 and R2 are different.

Answer: C

Explanation:

Verify that the replica has processed all the transactions it has received from the primary. This ensures that when promoted, the replica reflects all transactions that were received before the primary became unavailable.

https://cloud.google.com/sql/docs/postgres/replication/cross-region-replicas#verify_failover_criteria

NEW QUESTION # 54

Your organization has a busy transactional Cloud SQL for MySQL instance. Your analytics team needs access to the data so they can build monthly sales reports. You need to provide data access to the analytics team without adversely affecting performance. What should you do?

- A. Provide the database IP address, username, and password of the primary database instance to the analytics team, and grant read access to required tables to the team.
- B. Enable the `cloudsql.iam_authentication` flag on the primary database instance, and grant read access to required tables to the analytics team.
- C. Create a read replica of the database, provide the database IP address, username, and password to the analytics team, and grant read access to required tables to the team.
- D. Create a read replica of the database, enable the `cloudsql.iam_authentication` flag on the replica, and grant read access to required tables to the analytics team.

Answer: A
