Fortinet FCSS - LAN Edge 7.6 Architect Sample Questions (Q16-Q21):

NEW QUESTION # 16

You are configuring FortiAuthenticator to integrate with FSSO for user identification. To enable FortiAuthenticator to extract user information from syslog messages and inject it into FSSO, you have configured syslog matching rules.

What is the role of syslog matching rules in the process of injecting user information into FSSO?

- A. To enforce user authentication policies based on syslog message contents
- B. To filter and block irrelevant syslog messages from being processed by the FortiAuthenticator
- C. To define how syslog messages are parsed and extract user information, such as usernames and IP addresses
- D. To automatically update user group memberships in FSSO based on syslog events

Answer: C

Explanation:

When FortiAuthenticator is used as an FSSO agent based on syslog, it must:

* Parse incoming syslog messages from devices (firewalls, WLAN controllers, VPN concentrators, etc.).

* Extract identity fields such as:

* Username

* IP address

* Login/logout event indicators

Syslog matching rules on FortiAuthenticator define:

* Which syslog messages are relevant (by facility, message pattern, or regex).

* How to capture specific fields (username, IP, group, event type).

FortiAuthenticator then uses this parsed data to inject logon sessions into FSSO, so FortiGate can apply identity-based policies.

Thus, the role of syslog matching rules is exactly as described in C.

* A: Group mapping is handled separately via directory groups / FSSO config, not directly by matching rules.

* B: Enforcement of authentication policies is done on FortiGate, not directly by the matching rules.

* D: While irrelevant logs can be ignored via rules, the primary purpose is parsing and extraction, not generic filtering.
