CrowdStrike Certified Cloud Specialist - 2025 Version Sample Questions (Q308-Q313):

NEW QUESTION # 308

You are tasked with creating a custom compliance framework within the CrowdStrike platform.

Which of the following steps is essential to ensure the framework meets organizational compliance needs and remains adaptable over time?

- A. Define a baseline of security controls aligned with existing regulatory standards.

- B. Use default CrowdStrike compliance templates without modifications.
- C. Limit the framework to addressing only one regulatory standard at a time.
- D. Enable monitoring for endpoints but exclude periodic reporting.

Answer: A

Explanation:

Option A: Defining a baseline of security controls is a critical step in creating a custom compliance framework. This ensures that the framework aligns with existing regulations, industry standards, and organizational needs. A well-defined baseline also serves as a reference point for evaluating the effectiveness of the framework over time. Misalignment with regulations can lead to compliance gaps and legal repercussions.

Option B: Default templates provide a starting point, but they must be tailored to the organization's specific needs, regulatory landscape, and operational requirements. Using them without modifications may result in an incomplete or misaligned compliance framework.

Option C: A compliance framework should ideally address multiple standards, especially when overlaps exist, to streamline efforts and reduce redundancy. Limiting the scope to one standard at a time is inefficient and can increase operational complexity.

Option D: While endpoint monitoring is essential, excluding periodic reporting undermines the framework's ability to demonstrate ongoing compliance. Reporting helps identify deviations from compliance and facilitates audits.

NEW QUESTION # 309

You are registering a new AWS account with CrowdStrike Falcon, but the process fails with an error stating: 1. "Insufficient permissions for role ARN." What is the most likely cause of this issue?

- A. The CrowdStrike Falcon sensor is not installed on the EC2 instances in the account.
- B. Multi-factor authentication (MFA) is disabled on the AWS account.
- C. The IAM role created for the account lacks the required policies for CrowdStrike integration.
- D. The AWS account is already registered with another CrowdStrike instance.

Answer: C

Explanation:

Option A: MFA is not a requirement for registering an AWS account with CrowdStrike Falcon. Its absence does not affect the IAM role's ability to function properly.

Option B: While this might cause an issue during registration, the error message in the scenario specifically references "insufficient permissions," which points to an IAM role misconfiguration rather than a duplicate registration problem.

Option C: The CrowdStrike Falcon sensor installation is unrelated to the cloud account registration process. Sensor deployment happens after the account registration for endpoint protection.

Option D: This is the correct answer because the error indicates a permissions issue. The IAM role must have the correct policies attached to allow CrowdStrike to access the necessary resources in the AWS account. Common policies required include read-only access to services like EC2, CloudTrail, and VPC. Misconfiguring these policies will lead to registration errors.

NEW QUESTION # 310

A cloud security engineer is responsible for ensuring that their Kubernetes-based microservices architecture adheres to industry security standards. The organization wants to implement runtime security best practices and verify that their cluster configuration complies with the latest CIS (Center for Internet Security) benchmarks.

Which CrowdStrike Falcon feature should the engineer use to perform a compliance check against industry benchmarks?

- A. Falcon Horizon (CSPM)
- B. Falcon Forensics Collection
- C. Falcon Prevent (NGAV)
- D. Falcon Identity Protection

Answer: A

Explanation:

Option A: Falcon Identity Protection helps detect identity-based attacks and credential misuse but does not provide compliance checks for cloud or Kubernetes environments.

Option B: Falcon Prevent is a next-generation antivirus (NGAV) solution that protects against malware and endpoint threats, but it does not assess cloud infrastructure or Kubernetes configurations against compliance benchmarks.

Option C: Falcon Forensics is useful for post-incident investigations but does not provide real- time security posture monitoring or compliance checks against industry benchmarks.

Option D: Falcon Horizon is CrowdStrike's Cloud Security Posture Management (CSPM) solution, designed to monitor cloud, Kubernetes, and Docker configurations for compliance with security benchmarks such as CIS, NIST, and PCI-DSS. It provides continuous monitoring and remediation recommendations for misconfigurations, making it the best choice for compliance verification.

NEW QUESTION # 311

What is the primary benefit of using automated remediation in a cloud security workflow?

- **A. Reducing response time by taking immediate action on detected threats**
- B. Ensuring compliance with industry regulations without manual checks
- C. Increasing cloud environment performance by optimizing resource utilization
- D. Eliminating the need for human oversight during incident response

Answer: A

Explanation:

Option A: Automated remediation complements, but does not replace, human oversight. Security teams still need to review actions, analyze complex incidents, and refine policies to ensure proper functionality.

Option B: While automated remediation can support compliance by addressing security gaps promptly, it does not fully replace manual checks, audits, or detailed compliance reviews.

Option C: Automated remediation is focused on security incident response, not resource optimization. While securing the environment may have indirect performance benefits, this is not the primary goal.

Option D: The primary advantage of automated remediation is its ability to act quickly and mitigate threats as soon as they are detected, significantly reducing response time. This minimizes the potential impact of threats by containing them before they can escalate or cause further damage.

NEW QUESTION # 312

What is the potential impact if CrowdStrike IP addresses are not added to your container registry allowlist for image assessment?

- A. Image assessment will proceed with reduced capabilities.
- **B. Image assessment will fail, but other CrowdStrike services will continue to function.**
- C. Image assessment will continue without any issues due to fallback IP detection.
- D. CrowdStrike will switch to a default public IP to bypass the restriction.

Answer: B

Explanation:

Option A: This is incorrect because CrowdStrike does not use fallback public IPs to bypass restrictions. The exact IP addresses provided in the CrowdStrike Console must be allowlisted.

Option B: This is correct because failing to allowlist CrowdStrike IP addresses specifically affects the image assessment functionality. Other CrowdStrike services that do not rely on the registry allowlist may continue to operate normally.

Option C: This is incorrect because CrowdStrike does not have a fallback mechanism for IP detection in this context. The specified IP addresses must be explicitly allowlisted to enable image assessment.

Option D: This is incorrect because image assessment requires direct communication with the container registry. Without allowlisted IP addresses, the assessment will fail entirely, not operate with reduced capabilities.
