ISQI ISTQB Certified Tester - Foundation Level Extension - Agile Tester Sample Questions (Q10-Q15):

NEW QUESTION # 10

What is the main benefit of the Test Pyramid?

- A. It acts as a metric for testing progress.
- B. It means testing is involved early in the development cycle.
- C. It shows complexity of testing activities.
- **D. It helps in evaluating the amount of test cases needed.**

Answer: D

Explanation:

Explanation

The Test Pyramid is a model for organizing tests in a way to make the process of testing faster, efficient and cost-effective. This model focusses on getting maximum functional testing getting covered by faster and less brittle tests like Unit and API tests. The main benefit of the Test Pyramid is that it helps in evaluating the amount of test cases needed for each level of testing. The Test Pyramid suggests that the number of test cases should decrease as we move up the pyramid, from unit tests to integration tests to end-to-end tests. This is because unit tests are more granular, isolated, and easy to write and maintain, while end-to-end tests are more complex, dependent, and brittle. The Test Pyramid also helps in balancing the test coverage and the test execution time, as unit tests provide high coverage and low execution time, while end-to-end tests provide low coverage and high execution time. By following the Test Pyramid, teams can optimize their testing efforts and resources, and ensure that they have a sufficient and effective test suite for their software. References:

NEW QUESTION # 11

Which of the following statements about the testing quadrants model is true?

- A. Each of the four testing quadrants (Q1, Q2, Q3, and Q4) represents a different test level (Q1 = Unit, Q2 = Integration, Q3 = System, and Q4 = Acceptance) and describes the different test types that shall be performed by Agile teams in that test level for an Agile project
- **B. Each of the four testing quadrants (Q1, Q2, Q3, and Q4) contains different test types and test levels, and these quadrants can be used by Agile teams and other stakeholders to ensure that all important test types and test levels are included in an Agile project**
- C. Each of the four testing quadrants (Q1, Q2, Q3, and Q4) contains different test types and test levels, and these quadrants are numbered to describe the risk level associated with the test types (Q1 = least risky, Q4 = most risky)
- D. Each of the four testing quadrants (Q1, Q2, Q3, and Q4) contains different test types and test levels, and these quadrants are numbered to describe the order in which the associated test types and test levels shall be performed in an Agile project (Q1 first, Q4 last)

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

From CTFL-AT Syllabus v4.0, Section 3.4 The Testing Quadrants, it states:

"The Agile testing quadrants are used to ensure that the team considers all important test types and levels during an Agile project.

The quadrants categorize tests by their purpose (support development, critique the product) and by the type of feedback (business-facing vs technology-facing)." Thus, Option C correctly reflects the use and purpose of the quadrants as a guidance tool, not a fixed sequence or hierarchy.

* Option A and B are incorrect - the quadrants are not mapped to strict levels or chronological order.

* Option D is false - risk is not the basis for quadrant numbering.

NEW QUESTION # 12

You have been asked to explain to your client how to define acceptance criteria that are fully testable. Which of the following is the BEST EXAMPLE for testable acceptance criteria?

- A. The "ID" field must accept input value of a length between 2 and 10 characters.

- B. The interface to External System shall be specified.
- C. The program's icon should be clear and attractive.
- D. Action "Reopen" must be available only for a user with a specific authorization level.

Answer: D

NEW QUESTION # 13

Which of the following would provide the MOST independence for testers working with agile teams?

- A. Testers from an independent test team are assigned to the Agile team at the beginning of the project, returning for re-assignment to a new agile team.
- B. Testers from an independent test team who do not get involved with the Agile team, but are assigned to do System Testing once all sprints are completed.
- C. Testers from an independent test team are assigned on-demand for the final days of each sprint.
- D. Testers are fully embedded in each Agile team to perform many of the testing tasks.

Answer: B

Explanation:

Explanation

Independence in testing is the degree of separation between the person who tests something and the person who developed it. Independence can help to reduce bias, increase objectivity, and provide different viewpoints. However, independence also has some drawbacks, such as increased communication overhead, reduced collaboration, and delayed feedback. In agile projects, testers are usually embedded in the agile teams to perform many of the testing tasks, such as unit testing, integration testing, acceptance testing, etc. This provides a high level of collaboration and fast feedback, but also reduces the independence of the testers.

Testers from an independent test team who do not get involved with the agile team, but are assigned to do System Testing once all sprints are completed, would provide the most independence for testers working with agile teams. However, this would also introduce many disadvantages, such as lack of alignment with the agile principles, loss of context and domain knowledge, delayed defect detection and resolution, and increased risk of missing customer expectations. NEW QUESTION # 14

You are a tester in an agile team. The user story you are due to test is still under development so your tests are blocked. The main issue holding progress on this user story is that the developer's unit tests are constantly failing.

As an agile tester, which of the following actions should you take?

- A. Create a bug report for each of your blocked tests.
- B. Work together with the developer, suggesting reasons why the tests are failing.
- C. Review the design of the problematic user story and improve it where possible.
- D. Use the time to improve and automate existing test cases of other user stories.
