ServiceNow Certified Application Developer-ServiceNow Sample Questions (Q73-Q78):

NEW QUESTION # 73

Which of the following are configured in an Email Notification?

- a) Who will receive the notification.
- b) What content will be in the notification.
- c) When to send the notification.
- d) How to send the notification.

- A. b, c and d
- B. a, c and d
- C. a, b and c
- D. a, b, and d

Answer: C

Explanation:

https://docs.servicenow.com/bundle/tokyo-servicenow-platform/page/administer/notification/task/t_CreateANotification.html

Reference: https://hi.service-now.com/kb_view.do?sysparm_article=KB0712569 An Email Notification is a record that defines the content and conditions for sending an email message from the ServiceNow platform. The following are configured in an Email Notification:

Who will receive the notification. This is specified by the Recipients related list, which can include users, groups, email addresses, or scripts that return email addresses.

What content will be in the notification. This is specified by the Subject and Message HTML fields, which can include variables, scripts, or templates to dynamically generate the email content.

When to send the notification. This is specified by the When to send tab, which defines the conditions and events that trigger the email notification.

The following is not configured in an Email Notification:

How to send the notification. This is not a configuration option for an Email Notification. The platform uses the SMTP protocol to send email messages, and the email properties control the email server settings and behavior. References: Email Notifications, Get Started with Notifications

NEW QUESTION # 74

Client-side scripts manage what?

- A. Database and backend
- B. Playbook access
- C. User access
- D. Forms and Forms Fields

Answer: A

Explanation:

https://docs.servicenow.com/bundle/tokyo-application-development/page/script/server-scripting/concept/c_ServerScripting.html

NEW QUESTION # 75

When configuring a module, what does the Override application menu roles configuration option do?

- A. Users with access to the application menu can see the module even if they don't have the module role
- B. Self-Service users can access the module even though they do not have roles
- C. Admin is given access to the module even if Access Controls would ordinarily prevent access
- D. Users with the module role but without access to the application menu access the module

Answer: D

Explanation:

Checkbox tooltip: "Show this module when the user has the specified roles. Otherwise the user must have the roles specified by both the application menu and the module." The following is true for the Override application menu roles configuration option when configuring a module:

* Users with the module role but without access to the application menu access the module. This is true because the Override application menu roles option allows users to bypass the application menu role requirement and access the module directly if they have the module role. For example, if a module has the itil role and the Override application menu roles option enabled, and the application menu has the admin role, then a user who has the itil role but not the admin role can still access the module.

The following are not true for the Override application menu roles configuration option when configuring a module:

* Self-Service users can access the module even though they do not have roles. This is false because the Override application menu roles option does not grant access to the module to users who do not have any roles. Self-Service users are users who do not have any roles assigned to them and can only access the Self-Service portal and the Knowledge Base. To access the module, users need to have at least the module role.

* Admin is given access to the module even if Access Controls would ordinarily prevent access. This is false because the Override application menu roles option does not override the Access Control (ACL) rules that apply to the module. Access Control rules are used to restrict the access to the data and functionality of the ServiceNow platform based on the user's roles and conditions. Admin is a role Reference: https://hi.service-now.com/kb_view.do?sysparm_article=KB0716421

NEW QUESTION # 76

How does the Application Picker interact with Application Scope in ServiceNow?

- A. Global is a reserved application that does not appear in the Application Picker.
- B. Selecting an application from the Application Picker does not set the Application Scope.
- **C. Selecting an application from the Application Picker sets the Application Scope.**
- D. Selecting Global in the Application Picker sets the Application Scope to Incident.

Answer: C

Explanation:

In ServiceNow, the Application Picker is a user interface element that allows developers to select the active application they are working on. The selected application determines the Application Scope, which defines the boundaries within which application artifacts (like tables, scripts, and UI components) reside and operate.

* A. Selecting Global in the Application Picker sets the Application Scope to Incident: This is incorrect.

Selecting "Global" sets the scope to the global application, not specifically to the Incident application.

* B. Global is a reserved application that does not appear in the Application Picker: This is incorrect. The

"Global" application is available in the Application Picker and represents the global scope.

* C. Selecting an application from the Application Picker sets the Application Scope: This is correct.

Choosing an application from the Application Picker establishes that application's scope as the current context for development and configuration.

* D. Selecting an application from the Application Picker does not set the Application Scope: This is incorrect. The Application Picker directly influences the current Application Scope.

For more information, refer to the official ServiceNow documentation on Application Scope.
