Network Appliance NetApp Certified Support Engineer Sample Questions (Q47-Q52):

NEW QUESTION # 47

A user can read and write some files on an NFS volume, but the user is unable to read all of the files in the volume. In this scenario, which command will help you troubleshoot this problem?

- A. vserver export-policy check-access
- B. security login create
- C. security audit show
- D. vserver security trace filter create

Answer: D

Explanation:

vserver security trace filter create is the appropriate command to troubleshoot why a user can read and write some files on an NFS volume but cannot read all files. The symptom points to file-level access evaluation rather than a simple export-policy failure. Export-policy check-access is useful to test whether a client can access an export path based on export rules, but it does not fully explain

per-file permission differences inside the volume. security login create is for administrator login configuration and is unrelated to client file access.

security audit show does not perform targeted access-decision tracing. ONTAP security trace can be used to trace NAS access decisions and identify whether permissions, user mapping, security style, ACLs, or UNIX mode bits are causing the denial. A support engineer should use it when access is inconsistent across files in the same volume. References/topics: ONTAP security trace, NFS file access troubleshooting, UNIX permissions, mixed security styles, and NAS authorization diagnostics.

NEW QUESTION # 48

When you expand an aggregate, the space partition can be added as only a new RAID group, even though the current RAID group size is large enough for the current and new partitions.

In this scenario, which statement is correct?

- A. The aggregate must be converted to RAID-TEC to expand RAID groups using partitions.
- B. Only nonpartitioned disks can be added to RAID group with existing partitions.
- **C. The partitions to be added share disks with the partition in the existing group.**
- D. RAID group size is used only when dealing with non-partitioned disks.

Answer: C

NEW QUESTION # 49

A storage administrator explains that when he enabled a virus scan on a clustered Data ONTAP 8.3.2 SVM "svml" at 8:00 a.m. BST this morning, all CIFS share user access was impacted and customers reported receiving "access denied" errors. After the storage administrator disabled the virus scan on "svml", user access was restored 30 minutes later.

Now the storage administrator wants to know the root cause of the problem. When you begin collecting event management system (EMS) logs, you discover the errors shown in the exhibit.

What was the root cause of the outage after the virus scan was enabled on "svml"?

- A. The IP address (172.16.16.74) attempting to connect to the privileged ONTAP_ADMIN\$ share is not found in the list of allowed IP addresses.
- B. The logged-in user (domain\vscan_admin1) attempting to connect to the privileged ONTAP_ADMIN\$ share is not found in the list of allowed users.
- **C. Virus scan is enabled on the wrong SVM.**
- D. Symantec Protection Engine is not one of our supported virus scan vendors.

Answer: C
