Quiz Confluent - CCDAK –The Best Exam Demo

VCE4Dumps is a website to achieve dreams of many IT people. VCE4Dumps provide candidates participating in the IT certification exams the information they want to help them pass the exam. Do you still worry about passing Confluent certification CCDAK exam? Have you thought about purchasing an Confluent certification CCDAK exam counseling sessions to assist you? VCE4Dumps can provide you with this convenience. VCE4Dumps's training materials can help you pass the certification exam. VCE4Dumps's exercises are almost similar to real exams. With VCE4Dumps's accurate Confluent Certification CCDAK Exam practice questions and answers, you can pass Confluent certification CCDAK exam with a high score.

Confluent Certified Developer for Apache Kafka Certification Examination Sample Questions (Q68-Q73):

NEW QUESTION # 68

Which type of system best describes Apache Kafka? (Choose 2.)

- A. Quorum based
- B. Leader-follower
- C. FIFO
- D. Publish-subscribe messaging
- E. Distributed commit log

Answer: D,E

NEW QUESTION # 69

You are composing a REST request to create a new connector in a running Connect cluster. You invoke POST /connectors with a configuration and receive a 409 (Conflict) response.

What are two reasons for this response? (Select two.)

- A. The connect cluster has reached capacity, and new connectors cannot be created without expanding the cluster.
- B. The connector configuration was invalid, and the response body will expand on the configuration error.
- C. The Connector already exists in the cluster.
- D. The Connect cluster is in process of rebalancing.

Answer: C,D

Explanation:

A 409 Conflict response in Kafka Connect REST API usually means:

- * The connector name provided already exists (i.e., a connector with that name is already deployed).
- * The Kafka Connect cluster is temporarily unavailable to accept new tasks due to a rebalance in progress.

From the Confluent Developer documentation and Kafka Connect REST API spec:

"409 - Conflict. The connector name is already in use or the worker group is in the process of rebalancing and cannot complete the request at this time." Option A is incorrect because invalid configurations return 400 Bad Request, not 409.

Option B is invalid because Kafka Connect does not have a strict concept of "capacity" that prevents connector creation with a 409.

Reference: Apache Kafka Connect REST API documentation

NEW QUESTION # 70

A Kafka cluster has four brokers with a topic t1 with eight partitions. A client application has just one broker specified in the bootstrap URL.

Brokers:

b1.host.domain.com

b2.host.domain.com

b3.host.domain.com

b4.host.domain.com

Bootstrap URL:

b2.host.domain.com

What would be the impact of such configuration?

- A. Consumers and producers will not be able to consume or produce any messages.
- B. Consumers and producers will only be able to consume and produce from partitions on broker b2.
- C. Consumers and producers will get NotEnoughReplicasException.
- D. Consumers and producers will work as expected as long as broker b2 is available.

Answer: D

NEW QUESTION # 71

Consumer failed to process record # 10 and succeeded in processing record # 11. Select the course of action that you should choose to guarantee at least once processing

- A. Do not commit until successfully processing the record #10
- B. Commit offsets at 11
- C. Commit offsets at 10

Answer: B

Explanation:

Here, you shouldn't commit offsets 11 or 10 as it would indicate that the message #10 has been processed successfully.

NEW QUESTION # 72

(You need to send a JSON message on the wire. The message key is a string

How would you do this?)

- A. Specify a key serializer class for the JSON contents of the message's value. Set the value serializer class to null.
- **B. Specify a value serializer class for the JSON contents of the message's value. Set a key serializer for the string value.**
- C. Specify a value serializer class for the JSON contents of the message's value. Set the key serializer class to JSON.
- D. Specify a value serializer class for the JSON contents of the message's value. Set the key serializer class to null.

Answer: B

Explanation:

According to the Apache Kafka producer documentation, serialization is configured independently for message keys and values. The key and value can use different serializers depending on their data types.

In this scenario, the message key is a string, so the producer must be configured with `org.apache.kafka`.

`common.serialization.StringSerializer` for the key. The value contains JSON, so a suitable JSON serializer must be configured for the value, such as a custom JSON serializer, a library-based serializer, or a byte-array serializer after converting the JSON to bytes.

Option B correctly reflects this separation by specifying a string serializer for the key and a JSON serializer for the value. Kafka does not automatically infer serializers, and setting a serializer to null is invalid.

Additionally, there is no built-in "JSON" serializer for keys, making Option D incorrect.

Therefore, the correct approach—fully aligned with Kafka's producer configuration model—is to explicitly configure a `StringSerializer` for the key and a JSON-capable serializer for the value.

NEW QUESTION # 73
