CertiProf Ethical Hacking Professional Certification Exam Sample Questions (Q72-Q77):

NEW QUESTION # 72

What is masquerading?

- A. Impersonating the identity of a legitimate user or system to gain unauthorized access.
- B. A web authentication method.
- C. A method for masking network traffic only.

Answer: A

Explanation:

Masquerading is an attack technique in which an attacker impersonates a legitimate user, device, or system to gain unauthorized access, making option C the correct answer. This can involve stolen credentials, forged identities, or spoofed system information. Masquerading attacks are commonly associated with credential theft, session hijacking, and privilege abuse.

Ethical hackers test for masquerading risks by assessing authentication mechanisms, access controls, and identity management systems.

Option A is incorrect because masking traffic alone does not define masquerading. Option B is incorrect because masquerading is not a legitimate authentication method.

Understanding masquerading is essential for mitigating identity-based attacks. Defenses include strong authentication, multi-factor authentication, logging, and anomaly detection.

Ethical hackers help organizations identify weaknesses that allow masquerading and implement controls to prevent impersonation-based attacks.

Here are the 100% verified answers for the first batch of questions, aligned with the provided documentation and standard ethical hacking principles.

NEW QUESTION # 73

Security Vulnerabilities: Understanding Backdoors

- A. It is a type of hacker who exploits vulnerabilities in search of information that can compromise a company and sell this information in order to make a profit regardless of the damage it may cause to the organization.
- B. Refers to a computer security professional or expert who uses their skills and knowledge to identify and fix vulnerabilities in systems, networks or applications for the purpose of improving security and protecting against potential cyber threats.
- C. A person who creates exploits with the sole purpose of exposing existing vulnerable systems.

Answer: B

Explanation:

The term "Whitehack," more commonly known as a "White Hat Hacker," describes individuals who utilize their technical expertise for ethical and legal purposes. These professionals are the cornerstone of the ethical hacking community. They operate under a strict code of ethics and, most importantly, always obtain explicit, written permission before conducting any security assessments or penetration tests. Their primary objective is to strengthen an organization's security posture by proactively discovering vulnerabilities before malicious actors (Black Hats) can exploit them.

White Hat hackers perform various tasks, including penetration testing, vulnerability assessments, security auditing, and developing security protocols. When they identify a flaw, they do not exploit it for personal gain or damage; instead, they document the finding in a comprehensive report and provide actionable remediation advice to the organization's IT and security teams. This collaborative approach helps organizations understand their weaknesses and allocate resources effectively to mitigate risks. Many White Hat

hackers are certified professionals, holding credentials such as Certified Ethical Hacker (CEH) or Offensive Security Certified Professional (OSCP). They often work as security consultants, in-house security analysts, or as part of specialized "Red Teams" that simulate real-world attacks to test defensive capabilities. By mimicking the tactics, techniques, and procedures (TTPs) of real adversaries within a controlled and authorized framework, White Hats provide invaluable insights that automated tools alone cannot achieve. Their work is essential in the modern digital landscape, where the constant evolution of threats requires a defensive strategy that is equally dynamic and informed by a deep understanding of the "hacker mindset." Ultimately, the distinction between a White Hat and other types of hackers is defined by intent, authorization, and the commitment to improving the safety of the digital ecosystem.

NEW QUESTION # 74

What is ethical responsibility in hacking?

- A. Ensuring that scanning and testing are performed with proper authorization and for legitimate purposes.
- B. Performing scanning activities with technical knowledge only.
- C. Ensuring that scanning is performed without permission and for illegitimate purposes.

Answer: A

Explanation:

Ethical responsibility in hacking refers to the obligation to perform all security testing activities legally, transparently, and with explicit authorization, making option B the correct answer. Ethical hacking is not defined solely by technical skill, but by adherence to legal boundaries, professional conduct, and organizational policies.

Ethical hackers must always obtain written permission before conducting reconnaissance, scanning, or exploitation activities. This authorization clearly defines the scope, targets, and limitations of the engagement.

Without permission, even basic scanning activities may be considered illegal or unethical, regardless of intent.

Option A is incorrect because technical knowledge alone does not make hacking ethical. Skills must be applied responsibly. Option C is incorrect because performing scans without permission is a violation of ethical and legal standards and may result in criminal charges.

From an ethical hacking perspective, responsibility also includes responsible disclosure, minimizing impact, protecting sensitive data, and reporting findings accurately. Ethical hackers must avoid data misuse, service disruption, or unnecessary system damage. Understanding ethical responsibility is foundational to professional cybersecurity practice. It distinguishes ethical hackers from malicious actors and ensures that security testing contributes positively to risk reduction, compliance, and organizational trust.

NEW QUESTION # 75

What is a dictionary used for brute-force attacks?

- A. A plain text document where passwords are usually stored.
- B. A common dictionary that contains words and their meanings.
- C. A document containing a list of possible passwords that may successfully authenticate into a system.

Answer: C

Explanation:

In ethical hacking and penetration testing, a dictionary used for brute-force or dictionary attacks is a file containing a list of potential passwords that an attacker or tester attempts against a target authentication mechanism. Therefore, option C is the correct answer.

Dictionary files are typically plain text documents that include commonly used passwords, leaked credentials, default passwords, variations of words, and patterns frequently chosen by users. Ethical hackers use these dictionaries during password auditing and authentication testing to assess the strength of password policies implemented by an organization.

Option A is incorrect because a traditional language dictionary explains word meanings and is not structured for authentication testing. Option B is also incorrect because passwords are not normally stored in readable plain text documents; secure systems store passwords using hashing and salting mechanisms.

From a security perspective, dictionary attacks exploit human behavior, particularly the tendency to choose weak or predictable passwords. Ethical hackers simulate these attacks in controlled environments to demonstrate the risks of poor password hygiene.

The results help organizations enforce stronger password policies, multi-factor authentication, and account lockout mechanisms.

Understanding dictionary-based brute-force attacks is essential for managing attack vectors, as credential compromise remains one of the most common entry points for attackers. Ethical use of dictionaries allows organizations to proactively identify weaknesses before malicious actors exploit them.

NEW QUESTION # 76

What tool would you use to search for hidden directories or files?

- A. Dirb
- B. Ping
- C. Shodan

Answer: A

Explanation:

DIRB is a specialized web content scanning tool used in ethical hacking and penetration testing to discover hidden directories and files on web servers. It operates by performing a dictionary-based brute-force attack against a target website, attempting to access directories and files that are not publicly linked but may still be accessible. This makes option A the correct answer.

DIRB is typically used during the web application reconnaissance and enumeration phases of penetration testing. Ethical hackers rely on it to uncover misconfigurations such as exposed admin panels, backup files, configuration files, or outdated directories that could lead to further compromise. These hidden resources often exist due to poor security practices or improper cleanup during development.

Option B, Shodan, is incorrect because Shodan is a search engine used to discover internet-connected devices and services, not hidden directories within a specific website. Option C, Ping, is also incorrect because it is a network utility used only to test host reachability and does not interact with web servers at the application layer.

From a defensive security perspective, DIRB helps organizations identify unnecessary exposure in web environments. Discovering hidden directories allows administrators to remove, restrict, or secure them before attackers exploit them. When used ethically and with authorization, DIRB is a powerful tool for improving web application security and reducing attack surfaces.
