ServiceNow CAD certification provides developers with a competitive edge in the job market. Certified Application Developer-ServiceNow certification showcases the developer's expertise in the ServiceNow platform and increases their chances of getting hired by companies that use ServiceNow. Certified Application Developer-ServiceNow certification also opens up new career opportunities for developers, such as ServiceNow developers, administrators, and consultants.

ServiceNow CAD exam is designed for experienced developers who work on ServiceNow platform. Certified Application Developer-ServiceNow certification helps demonstrate an individual's proficiency in ServiceNow application development and enables them to develop, configure, and customize ServiceNow platforms efficiently. The ServiceNow CAD Certification also provides an opportunity to increase earning potential as it shows that one is a skilled professional in ServiceNow development. Thus, as the market demand for certified ServiceNow developers increases, the ServiceNow CAD certification becomes more valuable to individuals and organizations alike.

2026 ServiceNow Updated CAD: Certified Application Developer-ServiceNow Exam Assessment

This updated CAD exam study material consists of CAD PDF dumps, desktop practice exam software, and a web-based practice test. Experts have prepared the CAD desktop-based exam simulation software. There are CAD Actual Questions in the practice test to give you an exact impression of the ServiceNow CAD original test.

ServiceNow Certified Application Developer-ServiceNow Sample Questions (Q161-Q166):

NEW QUESTION # 161

Is it possible to change an application's scope?

- A. Yes. but only from private scope to global scope
- B. Yes, but only from global scope to private scope
- C. No, it's not possible.
- D. Yes it's possible.

Answer: D

Explanation:

It is possible to change an application's scope in ServiceNow, either from global to private or from private to global. However, changing the scope of an application may affect its functionality and compatibility with other applications. Therefore, it is recommended to test the application thoroughly before and after changing its scope.

- * How to move Custom Scoped Applications between instances - ServiceNow
- * Steps to switch a scoped application from your company's application repository to update sets - ServiceNow
- * How to change the application (scope) of a SLA Definition without needing to recreate the SLA Definition - ServiceNow
- * Advantages of Scoped Applications in ServiceNow - QualityClouds

NEW QUESTION # 162

How does ServiceNow match inbound email to an existing record? (Choose 2 answers)

- A. Subject line with record number
- B. Record link
- C. Sys_id
- D. Watermark

Answer: A,D

Explanation:

Inbound email matching uses Watermarks and Subject lines (with record numbers like INC0010001) to associate emails with existing records.

From Email Handling Docs:

"ServiceNow uses Watermark IDs and subject lines containing record numbers to find the corresponding task or record when processing inbound email."

NEW QUESTION # 163

The source control operation used to store local changes on an instance for later application is called a(n) `<blank>`.

- A. Update set
- B. Stash
- C. Branch
- D. Tag

Answer: C

Explanation:

The source control operation used to store local changes on an instance for later application is called a stash. A stash is a temporary storage area for uncommitted changes that are not ready to be pushed to a remote repository. Developers can use stashes to save their work in progress without committing it to the local repository or discarding it. Stashes can be applied later to restore the changes to the working directory, or dropped if they are no longer needed. Reference: [ServiceNow Docs - Stash local changes], [ServiceNow Docs - Source control]

NEW QUESTION # 164

When working in the Form Designer, configuring the label of a field in a child table changes the label on which table(s)?

- A. base table
- B. child table
- C. parent table
- D. all tables

Answer: B

Explanation:

Configuring the label of a field in a child table changes the label only on that table, not on the base table or the parent table. The base

table is the table that contains the common fields for all the extended tables, and the parent table is the table that is directly extended by the child table. The label of a field on the base table or the parent table can be different from the label on the child table.
References: [ServiceNow Docs - Table extension], [ServiceNow Community - How to change field label in child table] Reference: https://community.servicenow.com/community?id=community_question&sys_id=7ddc4462dbe2b3840be6a345ca9619af

NEW QUESTION # 165

When configuring a REST Message, the Endpoint is:

- A. The response from the provider indicating there is no data to send back
- B. Information about the format of the returned data
- C. The commands to the REST script to stop execution
- D. The URI of the data to be accessed, queried, or modified

Answer: D

Explanation:

When configuring a REST Message, the Endpoint is:

The URI of the data to be accessed, queried, or modified. This is the correct answer because the Endpoint is the part of the REST Message that specifies the location and the resource of the REST provider. The Endpoint is composed of the base URL and the resource path, which can include query parameters or variables. For example, the Endpoint for a REST Message that retrieves the weather information for a city from a web service could be <https://api.openweathermap.org/data/2.5/weather?q=London>.

The following are not correct definitions of the Endpoint when configuring a REST Message:

The commands to the REST script to stop execution. This is not correct because the commands to the REST script to stop execution are not part of the REST Message, but of the Scripted REST API, which is a feature that allows users to create custom REST endpoints on the ServiceNow platform. The commands to the REST script to stop execution are methods of the RESTAPIResponse object, such as `setStatusCode`, `setError`, or `complete`.

Information about the format of the returned data

a. This is not correct because the information about the format of the returned data is not part of the Endpoint, but of the HTTP headers or the Accept field of the REST Message. The HTTP headers or the Accept field can be used to specify the content type of the response, such as JSON, XML, or HTML.

The response from the provider indicating there is no data to send back. This is not correct because the response from the provider indicating there is no data to send back is not part of the Endpoint, but of the HTTP status code or the response body of the REST Message. The HTTP status code or the response body can be used to indicate the result of the REST request, such as 200 OK, 404 Not Found, or 500 Internal Server Error. Reference: REST Messages, Scripted REST APIs

NEW QUESTION # 166

.....

If you want to learn the CAD practice guide anytime, anywhere, then we can tell you that you can use our products on a variety of devices. As you can see on our website, we have three different versions of the CAD exam questions: the PDF, Software and APP online. Though the content of them are the same. But the displays are totally different. And you can use them to study on different time and conditions. If you want to know them clearly, you can just free download the demos of the CAD Training Materials!
